(Received March 14, 2012)

We additionally selected thermodynamic data for solid and gaseous phases of nickel, selenium, zirconium, technetium, thorium, uranium, neptunium, plutonium and americium to our thermodynamic database JAEA-TDB for geological disposal of radioactive waste of high-level and TRU wastes. We thermodynamically obtained equilibrium constant from addition and subtraction of Gibbs free energy of formation on nickel, selenium, zirconium, technetium, thorium, uranium, neptunium plutonium and americium, which were selected in the Thermochemical Database Project by the Nuclear Energy Agency in the Organisation for Economic Co-operation and Development. Furthermore, we collected and updated thermodynamic data on iodine, changed master species of technetium(IV), and added thermodynamic data on selenium due to improving reliability of the thermodynamic database. We prepared text files of the updated thermodynamic database (JAEA-TDB) for geochemical calculation programs of PHREEQC, EQ3/6 and Geochemist's Workbench. These text files are contained in the attached CD-ROM and will be available on our Website (<http://migrationdb.jaea.go.jp/>).

1. Introduction

Many radionuclides are contained in high-level radioactive waste (HLW) and are part of TRU waste packages and some of them have long half-lives (more than 10^4 year). It is necessary to estimate the solubility of the radionuclides in groundwaters and porewaters in an engineered barrier system for performance assessment of geological disposal of HLW and TRU wastes. Thermodynamic data, e.g., the equilibrium constant of solubility limiting solids at standard state (i.e. ionic strength of 0), are needed to estimate the solubility and aqueous species in the groundwater and porewater, and also data are fundamental information to estimating sorption and diffusion behaviors of chemical species on/in engineered barriers and host rocks. Therefore, the most reliable thermodynamic data should be integrated to carry out the reliable performance assessment by an implementation and regulatory organizations.

Japan Atomic Energy Agency (JAEA) has developed the thermodynamic database (JAEA-TDB) for the performance assessment of geological disposal of radioactive waste ^{1,2)}. Main part of the thermodynamic data in JAEA-TDB were selected and estimated by JAEA, however, some part of them were taken from data selected by the Nuclear Energy Agency (NEA) in the Organisation for Economic Co-operation and Development (OECD) ³⁾ and those selected by Japan Nuclear Cycle Development Institute (JNC; one of the predecessor of JAEA) ⁴⁾. The thermodynamic data were compiled and converted to be available for use of geochemical calculation programs, e.g., PHREEQC ⁵⁾, EQ3/6 ⁶⁾ and Geochemist's Workbench ⁷⁾ (shown in Tables 18 and 19 in the TDB report ¹⁾).

We accepted equilibrium constant values selected by the NEA ³⁾ to the previous version of JAEA-TDB. However, the NEA also selects many other thermodynamic data such as the Gibbs free energy of formation for compounds and gaseous species of which equilibrium constant has not been selected. Equilibrium constant can be derived from addition and subtraction of the Gibbs free energy of formation thermodynamically. In the present report, we calculated and additionally selected equilibrium constant values for using the Gibbs free energy of formation which the NEA selected from comprehensive point of view. Some equilibrium constant values selected by the NEA for gaseous species were also selected additionally, because it might be important to evaluate distribution of radionuclides in the air in case of a severe accident of nuclear power plant such as the Fukushima Daiichi.

Also we collected and updated thermodynamic data on iodine, which was important to evaluate distribution of radioiodine especially in the air at a severe accident of nuclear power

plant. Although we surveyed many literatures and tried to review and select thermodynamic data on iodine, it was difficult to select thermodynamic data due to lack of experimental conditions or continuous quotations within quotations. Therefore, we collected thermodynamic data from some representative handbooks and tables and replaced previous data with the present ones from a comprehensive point of view.

Furthermore, we revised thermodynamic data on selenium and technetium through accepting the latest values from several literatures and modifying master species, respectively.

2. Brief Summary on Development of JAEA-TDB

2.1 Selection of Thermodynamic Data

Selection of thermodynamic data for JAEA-TDB was performed on the basis of the fundamental plan ¹⁾, the content of which was briefly described below.

Selection of equilibrium constant of reaction at standard state (K°) was obligatorily performed, and selection of other thermodynamic values on enthalpy, entropy and heat capacity was recommended.

Thermodynamic data for chemical compounds and species for radioelements with naturally occurring elements (e.g., halogen, oxygen, carbon, nitrogen, sulfur, phosphorus) and some organic ligands were selected. Other thermodynamic data which were needed to select were quoted from those called “Auxiliary Data” selected by the NEA ³⁾.

Review and selection of thermodynamic values obtained from experimental data should be based on the “TDB-1” guideline by the OECD/NEA ⁸⁾. Thermodynamic values or databases selected by the NEA ³⁾ and Lothenbach *et al.* ⁹⁾, which were based on the “TDB-1” guideline ⁸⁾, could be selected to the JAEA-TDB after surveying the latest literature and checking consistency of the value in the database. Otherwise review and selection of thermodynamic values should be performed after surveying the literature to collect proposed thermodynamic data.

Application of chemical analogues and models should be considered to obtain thermodynamic values for some species for which there has been no published experimental data. Some unreliable thermodynamic values, which are important for the performance assessment of geological disposal of radioactive wastes, may be selected as tentative values while specifying their reliability and the needs for the values to be determined.

All thermodynamic values should be standardized at 298.15 K and at zero ionic strength, using the Brønsted-Guggenheim-Scatchard Model (usually called the “specific ion interaction theory (SIT)”) ³⁾ for correction of ionic strength.

2.2 Calculation of Equilibrium Constant from Gibbs Free Energy of Formation

Using the Hess’s law, change in Gibbs free energy of reaction ($\Delta_r G_m^\circ$) for some arbitrary reaction, e.g.,

where A, B, C and D are substances involving the reaction, and a , b , c and d are coefficients of the substances A, B, C and D, respectively,

is expressed using change in Gibbs free energy of formation ($\Delta_f G_m^\circ(X)$ for species or compound X) as follows:

$$\Delta_r G_m^\circ = c \Delta_f G_m^\circ(C) + d \Delta_f G_m^\circ(D) - a \Delta_f G_m^\circ(A) - b \Delta_f G_m^\circ(B) . \quad (2)$$

Logarithm of equilibrium constant at standard state ($\log_{10} K^\circ$) is derived from $\Delta_r G_m^\circ$ using the following equation:

$$\log_{10} K^\circ = - (\log_{10} e / R T) \Delta_r G_m^\circ \quad (3)$$

where R and T denote gas constant ($J \cdot K^{-1} \cdot mol^{-1}$) and absolute temperature (K), respectively.

Uncertainty (σ) of $\Delta_r G_m^\circ$ and $\log_{10} K^\circ$ is obtained from error propagation of $\Delta_f G_m^\circ(X)$ as follows:

$$\sigma(\Delta_r G_m^\circ) = (c \sigma(\Delta_f G_m^\circ(C))^2 + d \sigma(\Delta_f G_m^\circ(D))^2 + a \sigma(\Delta_f G_m^\circ(A))^2 + b \sigma(\Delta_f G_m^\circ(B))^2)^{1/2} \quad (4)$$

$$\sigma(\log_{10} K^\circ) = - (\log_{10} e / R T) \sigma(\Delta_r G_m^\circ) . \quad (5)$$

The obtained uncertainty of equilibrium constant ($\sigma(\log_{10} K^\circ)$) calculated using reactions (4) and (5) was usually larger than that obtained experimentally. We took smaller values of uncertainty from either experimentally obtained or calculated.

For use with geochemical calculation programs, dissociation reactions are defined for all compounds and gaseous species, i.e., the objective compounds and species are put on left-hand side and aqueous master species of the objective elements are put on right-hand side in their reactions.

3. Additional Selection or Revision of Thermodynamic data

3.1 Nickel

Additionally calculated and selected thermodynamic data on nickel compounds and gaseous species are listed in Table 1. Selected the Gibbs free energy of formation ($\Delta_f G^\circ_m$) are listed elsewhere ¹⁰⁾.

3.2.2 Additionally Selected Thermodynamic Data from Solubility Study

Iida *et al.* conducted a solubility study of selenium at high ionic strength with varying pH under anoxic conditions from oversaturation and undersaturation directions and determined the equilibrium constant at zero ionic strength ($\log_{10} K^\circ$) of the following reactions using the Brønsted- Guggenheim-Scatchard Model (usually called “Specific Ion Interaction Theory (SIT)”) ¹²⁾:

Experimental data obtained from both directions were identical, confirming that equilibrium was attained during the experimental periods. Considering the difference in activity coefficients between the calibration buffers and those of the high ionic strength solutions, they correctly determined pH. After equilibration for all experiments, all the XRD peaks of the solid phase were assigned to Se(cr). Therefore Se(am) and Se(cr) were recognized as candidates of the solubility-limiting solid. At $5 < \text{pH} < 8$, the value of $\log_{10} K^\circ$ for reaction ($\text{Se}(\text{s}) + \text{H}^+ + 2 \text{e}^- \Leftrightarrow \text{HSe}^-$) was higher than the value of $\log_{10} K^\circ$ for reaction ($\text{Se}(\text{cr}) + \text{H}^+ + 2 \text{e}^- \Leftrightarrow \text{HSe}^-$) calculated from the existing thermodynamic data ¹¹⁾ of $\Delta_f G_m^\circ(\text{Se}(\text{cr}))$ and $\Delta_f G_m^\circ(\text{HSe}^-)$. They concluded that the solubility-limiting solid was not Se(cr) but Se(am) probably due to the rapid precipitation and slow crystallization kinetics of Se(am). On the other hand, the assumption that the solubility-limiting solid was Se(am) at $9 < \text{pH} < 13$ led to the overestimation for the value of $\Delta_f G_m^\circ(\text{Se}_4^{2-})$. They mentioned that the crystallization of selenium was presumed to occur through polymerization and homogeneous nucleation of Se_4^{2-} at the high-pH region and selected Se(cr) as solubility-limiting solid. $\Delta_f G_m^\circ(\text{Se}_4^{2-})$ determined by them agrees with the existing

thermodynamic data ¹¹⁾ and has a smaller uncertainty.

We concluded the values of $\log_{10} K^\circ$ for reaction (6) and (7) are reliable and accepted them for JAEA-TDB. For use of geochemical calculation programs, formation reaction of Se_4^{2-} was defined as follows:

Use of $\log_{10} K^\circ$ value in reaction (7) and that in the following reactions selected in JAEA-TDB

the $\log_{10} K^\circ$ of reaction (8) was determined to 340.074 ± 0.562 .

Additionally selected thermodynamic data on selenium using the solubility data by Iida *et al.* ¹²⁾ were summarized in Table 3.

Table 3 Additionally selected thermodynamic data on selenium using the solubility data by Iida *et al.* ¹²⁾

3.4.2 Change of Master Species of Technetium(IV)

Technetium(IV) monooxo ion (TcO^{2+}) was set as a master species of technetium(IV) in the previous version of JAEA-TDB ^{1,2)} as shown in Table 6. However, the Gibbs free energy of formation of TcO^{2+} is shown as a lower limit ($> 116.799 \text{ kJ}\cdot\text{mol}^{-1}$) ¹⁴⁾, hence many $\log_{10} K^\circ$ values have not been determined. Therefore we changed master species of technetium(IV) to $\text{TcO}(\text{OH})_2(\text{aq})$ based on the recommendation by the NEA ¹⁵⁾. Selected $\log_{10} K^\circ$ values in the present version of JAEA-TDB are listed in Table 7.

Table 6 Selected thermodynamic data on technetium(IV) in the previous version of JAEA-TDB ^{1,2)}

3.5 Iodine

3.5.1 Collection of Thermodynamic Data

Thermodynamic data on iodine were taken from NEA-TDB (auxiliary data)³⁾ and Cross *et al.*¹⁶⁾ in the previous JAEA-TDB tentatively. We surveyed many literatures and tried to review and select thermodynamic data on iodine in accordance with the guideline for JAEA-TDB^{1,2)}.

As an example of articles reporting thermodynamic data on iodine, Horiguchi and Hagsawa¹⁷⁾ determined the iodine hydrolysis constant by measuring pH of iodine solution as follow,

They estimated HOI concentration to be same as H^+ concentration without considering the following side reaction reported by Eguchi *et al.*¹⁸⁾

Besides, the activity coefficients of all species were assumed to be unity in the evaluation of the equilibrium constant for equation (11). We judged that the equilibrium constants reported by

Horiguchi and Hagisawa¹⁷⁾ were unreliable due to these problematic points. On the other hand, the equilibrium constant for equation (12) were also unreliable because ionic strength for each sample was unadjusted in the experiment by Eguchi et al.¹⁸⁾

Allen and Keefer¹⁹⁾ determined the equilibrium constant for equation (11) ($K^\circ = 5.40 \times 10^{-13}$) and the following equation,

by means of spectrophotometric analyses of aqueous solutions of iodine. However, they did not confirm the existence of HOI(aq) and H₂OI⁺(aq). For this reason, we rejected their reported values, too.

It was difficult to select thermodynamic data due to lack of experimental conditions or continuous quotations within quotations. Therefore, for the purpose of making data set more exhaustive we collected thermodynamic data from some representative handbooks and tables (NEA-TDB³⁾, CRC Handbook²⁰⁾, Kagaku Binran²¹⁾ and NBS Tables²²⁾) and replaced previous data with the present ones. NEA-TDB³⁾ are reliable because only original experimental data were evaluated, not estimates, values from compilations or secondary citations with the emphasis on the scientific reliability. Numerous international experts made contributions to CRC Handbook²⁰⁾ which quoted data from NIST-JANAF Thermochemical Tables Fourth Edition²³⁾ as well as NBS Tables²²⁾. Thermodynamic data for Se and Po in NBS Tables²²⁾ were introduced for JNC to develop TDB⁴⁾, while Kagaku Binran²¹⁾ has never been adopted in the past TDB development project. For these reasons, we determined priority of data collection in order of NEA-TDB³⁾, CRC Handbook²⁰⁾, NBS Tables²²⁾ and Kagaku Binran²¹⁾. The collected data are shown in Table 8, including previously selected data and calculated $\Delta_r G^\circ_m$ and $\log_{10} K^\circ$ values using equations (2) and (3). The present data on iodine has approximately quadrupled in the number of iodide species from the previous one. We recognize that data without assigning uncertainties quoted from CRC Handbook²⁰⁾, Kagaku Binran²¹⁾ and NBS Tables²²⁾ should be treated as tentative values due to lack of the traceability of data.

3.5.2 Solubility Estimation for Simulated Porewaters

We recalculated distribution of aqueous iodine species for some simulated porewaters determined in the Second Progress Report on Geological Disposal of High-level Radioactive Waste (H12)²⁴⁾. We selected 3 typically simulated porewaters proposed in the ‘‘H12’’ report, which are Fresh-Reducing-High-pH (FRHP), Saline-Reducing-High-pH (SRHP) and Fresh-Oxidizing-High-pH (FOHP) porewaters²⁵⁾, to check evaluated and estimated solubility

under various conditions. Solubility-controlling solid phase was set to $I_2(\text{cr})$, which was a typical solid phase of iodine. The geochemical calculation program “PHREEQC” version 2.17⁵⁾ was used for calculation.

Contribution of I^- was 100 % for FRHP and SRHP, while those of I^- and $I_2\text{OH}^-$ were 42 % and 29 % (i.e. equivalent to 58 % of isolated iodine), respectively, for FOHP. The obtained results were different from those using the previous thermodynamic data. Although we did not succeed to review and select thermodynamic data on iodine, we believe the present results using more exhaustive data were more realistic than the previous ones.

3.6 Thorium

Some thermodynamic data on thorium aqueous species selected by the NEA³⁾ shown in Table 9, which were missing in the previous version of JAEA-TDB^{1,2)}, were additionally selected.

Additionally calculated and selected thermodynamic data on thorium compounds and gaseous species are listed in Table 10. Selected the Gibbs free energy of formation ($\Delta_f G_m^\circ$) are listed elsewhere³⁾.

3.7 Uranium

Additionally calculated and selected thermodynamic data on uranium compounds and gaseous species are listed in Table 11. Selected the Gibbs free energy of formation ($\Delta_f G_m^\circ$) are listed elsewhere ¹⁴⁾.

It should be noted that thermodynamic data on diuranate (e.g., Na₂U₂O₇(cr)) might control uranium(VI) solubility under oxidic and highly alkaline conditions ²⁷⁾. These thermodynamic data may be important for performance assessment of radioactive waste, especially for TRU and low-level wastes of which environment will be under oxidic and highly

alkaline conditions.

Table 11 Additionally selected thermodynamic data for uranium compounds and gaseous species

3.10 Americium

We focused selection of thermodynamic data on only americium(III) in the previous version of JAEA-TDB ^{1,2)}. We additionally selected those on americium with other redox states shown in Table 14 selected by the NEA ¹⁴⁾.

Additionally calculated and selected thermodynamic data on americium compounds and gaseous species are listed in Table 15. Selected the Gibbs free energy of formation ($\Delta_f G^\circ_m$) are listed elsewhere ¹⁴⁾. Although the chemical similarity among trivalent samarium, actinium, plutonium, americium and curium was applied, selected values in Table 14 and Table 15 were not transferred to the other trivalent elements because most of the reactions contained a redox reaction which was not applicable to the other trivalent elements. Applicability of the chemical similarity should be further discussed.

3.11 Auxiliary Data

Additionally calculated and selected auxiliary data on compounds and gaseous species are listed in Table 16. Selected the Gibbs free energy of formation ($\Delta_f G^\circ_m$) are listed elsewhere ³⁾.

4. Conclusions

We calculated additionally selected many equilibrium constant values using Gibbs free energy values of formation selected by the NEA. We also selected additional thermodynamic data on selenium, collected thermodynamic data on iodine and revised some thermodynamic data using the latest information. We carefully prepared the text files of JAEA-TDB available for the geochemical calculation programs of PHREEQC, EQ3/6 and Geochemist's Workbench. The prepared files are contained in the attached CD-ROM and will be uploaded onto JAEA's Website (<http://migrationdb.jaea.go.jp/>).

Appendix 1. Revised Thermodynamic Data Compiled for JAEA-TDB

Selected equilibrium constants for JAEA-TDB are shown in Table A1 and Table A2.

Table A1 Selected equilibrium constants of aqueous species for JAEA-TDB ready to use for the geochemical calculation programs (revised from Table A1 in the previous TDB report ²⁾)

Reactions and $\log_{10} K^\circ$ values written with bold letters are additionally selected or revised in the present report.

*1 Tentative values.

Appendix 2. Text Files of JAEA-TDB for Geochemical Calculation Programs

Enclosed CD-ROM contains three text files of JAEA-TDB for geochemical calculation programs. Correspondence between file name and its corresponding geochemical calculation program is shown in Table A3.

Table A3 Correspondence between file name and its corresponding geochemical calculation program

file name	corresponding geochemical calculation program
100331c2.tdb	PHREEQC ⁵⁾
100331e1.tdb	EQ3/6 Ver. 7.2c ⁶⁾
100331g1.tdb	Geochemist's Workbench ⁷⁾

This is a blank page.

国際単位系 (SI)

表1. SI 基本単位

基本量	SI 基本単位	
	名称	記号
長さ	メートル	m
質量	キログラム	kg
時間	秒	s
電流	アンペア	A
熱力学温度	ケルビン	K
物質	モル	mol
光	カンデラ	cd

表2. 基本単位を用いて表されるSI組立単位の例

組立量	SI 基本単位	
	名称	記号
面積	平方メートル	m ²
体積	立方メートル	m ³
速度	メートル毎秒	m/s
加速度	メートル毎秒毎秒	m/s ²
波数	数メートル	m ⁻¹
密度, 質量密度	キログラム毎立方メートル	kg/m ³
面積密度	キログラム毎平方メートル	kg/m ²
比体積	立方メートル毎キログラム	m ³ /kg
電流密度	アンペア毎平方メートル	A/m ²
磁界の強さ	アンペア毎メートル	A/m
量濃度 ^(a) , 濃度	モル毎立方メートル	mol/m ³
質量濃度	キログラム毎立法メートル	kg/m ³
輝度	カンデラ毎平方メートル	cd/m ²
屈折率 ^(b)	(数字の) 1	1
比透磁率 ^(b)	(数字の) 1	1

(a) 量濃度 (amount concentration) は臨床化学の分野では物質濃度 (substance concentration) ともよばれる。
 (b) これらは無次元量あるいは次元1をもつ量であるが、そのことを表す単位記号である数字の1は通常は表記しない。

表5. SI 接頭語

乗数	接頭語	記号	乗数	接頭語	記号
10 ²⁴	ヨタ	Y	10 ¹	デシ	d
10 ²¹	ゼタ	Z	10 ²	センチ	c
10 ¹⁸	エクサ	E	10 ³	ミリ	m
10 ¹⁵	ペタ	P	10 ⁶	マイクロ	μ
10 ¹²	テラ	T	10 ⁹	ナノ	n
10 ⁹	ギガ	G	10 ¹²	ピコ	p
10 ⁶	メガ	M	10 ¹⁵	フェムト	f
10 ³	キロ	k	10 ¹⁸	アト	a
10 ²	ヘクト	h	10 ²¹	ゼプト	z
10 ¹	デカ	da	10 ²⁴	ヨクト	y

表6. SIに属さないが、SIと併用される単位

名称	記号	SI 単位による値
分	min	1 min=60s
時	h	1h=60 min=3600 s
日	d	1 d=24 h=86 400 s
度	°	1°=(π/180) rad
分	'	1'=(1/60)°=(π/10800) rad
秒	"	1"=(1/60)'=(π/648000) rad
ヘクタール	ha	1ha=1hm ² =10 ⁴ m ²
リットル	L, l	1L=11=1dm ³ =10 ³ cm ³ =10 ⁻³ m ³
トン	t	1t=10 ³ kg

表7. SIに属さないが、SIと併用される単位で、SI単位で表される数値が実験的に得られるもの

名称	記号	SI 単位で表される数値
電子ボルト	eV	1eV=1.602 176 53(14)×10 ⁻¹⁹ J
ダルトン	Da	1Da=1.660 538 86(28)×10 ⁻²⁷ kg
統一原子質量単位	u	1u=1 Da
天文単位	ua	1ua=1.495 978 706 91(6)×10 ¹¹ m

表8. SIに属さないが、SIと併用されるその他の単位

名称	記号	SI 単位で表される数値
バール	bar	1 bar=0.1MPa=100kPa=10 ⁵ Pa
水銀柱ミリメートル	mmHg	1mmHg=133.322Pa
オングストローム	Å	1 Å=0.1nm=100pm=10 ⁻¹⁰ m
海里	M	1 M=1852m
バイン	b	1 b=100fm ² =(10 ⁻¹² cm ²)=10 ⁻²⁸ m ²
ノット	kn	1 kn=(1852/3600)m/s
ネーパ	Np	SI単位との数値的な関係は、 対数量の定義に依存。
ベール	B	
デジベル	dB	

表9. 固有の名称をもつCGS組立単位

名称	記号	SI 単位で表される数値
エルグ	erg	1 erg=10 ⁻⁷ J
ダイン	dyn	1 dyn=10 ⁻⁵ N
ポアズ	P	1 P=1 dyn s cm ⁻² =0.1Pa s
ストークス	St	1 St=1cm ² s ⁻¹ =10 ⁻⁴ m ² s ⁻¹
スチルブ	sb	1 sb=1cd cm ⁻² =10 ⁴ cd m ⁻²
フォト	ph	1 ph=1cd sr cm ⁻² 10 ⁴ lx
ガリ	Gal	1 Gal=1cm s ⁻² =10 ⁻² ms ⁻²
マクスウェル	Mx	1 Mx=1G cm ⁻² =10 ⁸ Wb
グウス	G	1 G=1Mx cm ⁻² =10 ⁴ T
エルステッド ^(c)	Oe	1 Oe ≙ (10 ⁷ /4π)A m ⁻¹

(c) 3元系のCGS単位系とSIでは直接比較できないため、等号「≙」は対応関係を示すものである。

表10. SIに属さないその他の単位の例

名称	記号	SI 単位で表される数値
キュリー	Ci	1 Ci=3.7×10 ¹⁰ Bq
レントゲン	R	1 R=2.58×10 ⁻⁴ C/kg
ラド	rad	1 rad=1cGy=10 ⁻² Gy
レム	rem	1 rem=1 cSv=10 ⁻² Sv
ガンマ	γ	1 γ=1 nT=10 ⁻⁹ T
フェルミ	f	1 f=1 fm=10 ⁻¹⁵ m
メートル系カラット		1メートル系カラット=200 mg=2×10 ⁻⁴ kg
トル	Torr	1 Torr=(101 325/760) Pa
標準大気圧	atm	1 atm=101 325 Pa
カロリー	cal	1cal=4.1858J (「15°C」カロリー), 4.1868J (「IT」カロリー), 4.184J (「熱化学」カロリー)
マイクロン	μ	1 μ=1μm=10 ⁻⁶ m

表3. 固有の名称と記号で表されるSI組立単位

組立量	SI 組立単位			
	名称	記号	他のSI単位による表し方	SI基本単位による表し方
平面角	ラジアン ^(b)	rad	1 ^(b)	m/m
立体角	ステラジアン ^(b)	sr ^(c)	1 ^(b)	m ² /m ²
周波数	ヘルツ ^(d)	Hz	1	s ⁻¹
力	ニュートン	N		m kg s ⁻²
圧力, 応力	パスカル	Pa	N/m ²	m ⁻¹ kg s ⁻²
エネルギー, 仕事, 熱量	ジュール	J	N m	m ² kg s ⁻²
仕事率, 工率, 放射束	ワット	W	J/s	m ² kg s ⁻³
電荷, 電気量	クーロン	C		s A
電位差 (電圧), 起電力	ボルト	V	W/A	m ² kg s ⁻³ A ⁻¹
静電容量	ファラド	F	C/V	m ⁻² kg ⁻¹ s ⁴ A ²
電気抵抗	オーム	Ω	V/A	m ² kg s ⁻³ A ⁻²
コンダクタンス	ジーメンズ	S	A/V	m ⁻² kg ⁻¹ s ³ A ²
磁束密度	ウェーバ	Wb	Vs	m ² kg s ⁻² A ⁻¹
磁束	テスラ	T	Wb/m ²	kg s ⁻² A ⁻¹
インダクタンス	ヘンリー	H	Wb/A	m ² kg s ⁻² A ⁻²
セルシウス温度	セルシウス度 ^(e)	°C		K
光照射度	ルーメン	lm		cd sr ^(c)
放射線核種の放射能 ^(f)	ベクレル ^(d)	Bq		s ⁻¹
吸収線量, 比エネルギー分与, カーマ	グレイ	Gy	J/kg	m ² s ⁻²
線量当量, 周辺線量当量, 方向性線量当量, 個人線量当量	シーベルト ^(g)	Sv	J/kg	m ² s ⁻²
酸素活性	カタール	kat		s ⁻¹ mol

(a) SI接頭語は固有の名称と記号を持つ組立単位と組み合わせても使用できる。しかし接頭語を付した単位はもはやコヒーレントではない。
 (b) ラジアンとステラジアンは数字の1に対する単位の特別な名称で、量についての情報をつたえるために使われる。実際には、使用する時には記号rad及びsrが用いられるが、習慣として組立単位としての記号である数字の1は明示されない。
 (c) 測光学ではステラジアンという名称と記号srを単位の表し方の中に、そのまま維持している。
 (d) ヘルツは周期現象についてのみ、ベクレルは放射性核種の統計的過程についてのみに使用される。
 (e) セルシウス度はケルビンの特別な名称で、セルシウス温度を表すために使用される。セルシウス度とケルビンの単位の大きさは同一である。したがって、温度差や温度間隔を表す数値はどちらの単位で表しても同じである。
 (f) 放射性核種の放射能 (activity referred to a radionuclide) は、しばしば誤った用語で「radioactivity」と記される。
 (g) 単位シーベルト (PV,2002,70,205) についてはCIPM勧告2 (CF-2002)を参照。

表4. 単位の中に固有の名称と記号を含むSI組立単位の例

組立量	SI 組立単位		
	名称	記号	SI 基本単位による表し方
粘り	パスカル秒	Pa s	m ⁻¹ kg s ⁻¹
力のモーメント	ニュートンメートル	N m	m ² kg s ⁻²
表面張力	ニュートン毎メートル	N/m	kg s ⁻²
角速度	ラジアン毎秒	rad/s	m m ⁻¹ s ⁻¹ =s ⁻¹
角加速度	ラジアン毎秒毎秒	rad/s ²	m m ⁻¹ s ⁻² =s ⁻²
熱流密度, 放射照度	ワット毎平方メートル	W/m ²	kg s ⁻³
熱容量, エントロピー	ジュール毎ケルビン	J/K	m ² kg s ⁻² K ⁻¹
比熱容量, 比エントロピー	ジュール毎キログラム毎ケルビン	J/(kg K)	m ² s ⁻² K ⁻¹
比エネルギー	ジュール毎キログラム	J/kg	m ² s ⁻²
熱伝導率	ワット毎メートル毎ケルビン	W/(m K)	m kg s ⁻³ K ⁻¹
体積エネルギー	ジュール毎立方メートル	J/m ³	m ⁻¹ kg s ⁻²
電界の強さ	ボルト毎メートル	V/m	m kg s ⁻³ A ⁻¹
電荷密度	クーロン毎立方メートル	C/m ³	m ⁻³ s A
電表面積電荷	クーロン毎平方メートル	C/m ²	m ⁻² s A
電束密度, 電気変位	クーロン毎平方メートル	C/m ²	m ⁻² s A
誘電率	ファラド毎メートル	F/m	m ⁻³ kg ⁻¹ s ⁴ A ²
透磁率	ヘンリー毎メートル	H/m	m kg s ⁻² A ⁻²
モルエネルギー	ジュール毎モル	J/mol	m ² kg s ⁻² mol ⁻¹
モルエントロピー, モル熱容量	ジュール毎モル毎ケルビン	J/(mol K)	m ² kg s ⁻² K ⁻¹ mol ⁻¹
照射線量 (X線及びγ線)	クーロン毎キログラム	C/kg	kg ⁻¹ s A
吸収線量	グレイ毎秒	Gy/s	m ² s ⁻³
放射強度	ワット毎ステラジアン	W/sr	m ³ m ⁻² kg s ⁻³ =m ² kg s ⁻³
放射輝度	ワット毎平方メートル毎ステラジアン	W/(m ² sr)	m ² m ⁻² kg s ⁻³ =kg s ⁻³
酵素活性濃度	カタール毎立方メートル	kat/m ³	m ⁻³ s ⁻¹ mol
