3: C=====
4: C PURPOSE : INPUT CROSS-SECTION RELATED DATA
5: C
6: C << Comment >>
7: C Most of cross section modules of GMVP are borrowed from MORSE-CG
8: C and MORSE-DD (JAERI's hack enabling DDX type cross section),
9: C and their coding style is old-fashioned and confusing.
10: C Check for array pointer overflow may be imperfect at some points.
11: C Variables in a common area like /LOCSIG/ may have different names
12: C in other routines under XSECIN.
13: C They should be re-written into a modern coding style, I hope.
14: C
15: C SIGT(*) & NSIG(*) have the same memory address and equivalent to
16: C the array A(*) in common /ARRAY/, and pointed as SIGT/NSIG
17: C because of a historical reason commented above.
18: C
19: C Array index pointers are used differently from those in other parts
20: C of GMVP.
21: C For example, actual variable data area pointed by IRSG start from
22: C SIGT(IRSG+1) and not from SIGT(IRSG). The index pointers are
23: C corrected for use in other part of the program by incrementing their
24: C value.

src/gmvp/zzbank.f

```
1:      subroutine ZZBANK( KDBNK, MDBNK, KIBNK, MIBNK,  
2:      &                 KDFBK, MDFBK, KIFBK, MIFBK )  
3: C=====
```

4: C PURPOSE: Optional particle bank reservation for custom use.
5: C CALLED IN: INTRO2
6: C CALLS:
7: C-----

8: C About optional data bank arrays:
9: C
10: C Particle attributes are stored in arrays XXX(1:NBANK) (X-coordinates)
11: C EEE(1:NBANK) (energy) etc. in MVP/GMVP and they are used for fixed
12: C purpose.
13: C MVP/GMVP version2.x and newer has arrays called "optinal bank data"
14: C used for any purpose and their data size may vary depending on
15: C problems to be solved or used in custom version by user.
16: C
17: C DBNK(1:NBANK,*) : double word bank array.
18: C IBNK(1:NBANK,*) : double word bank array.
19: C DFBK(1:NFBNK0,*) : double word bank array for fission neutron in
20: C eigenvalue calculation mode.
21: C IFBK(1:NFBNK0,*) : double word bank array for fission neutron in
22: C eigenvalue calculation mode.
23: C
24: C Array KDBNK(*) is used to point specified optinal attributes in
25: C array DBNK like DBNK(*,KDBNK(1)). Some elements of KDBNK(*) have
26: C meanings defined by developer as:
27: C
28: C DBNK(*,KDBNK(1)) is particle weight on birth,
29: C DBNK(*,KDBNK(2)) is time of birth,
30: C ...
31: C
32: C and elements KDBNK(11) to KDBNK(16) are for custom use and users can
33: C give any attributes in their custom version.
34: C
35: C KIBNK, KDFBK and KIFBK works in similar way for arrays IBNK, DFBK and
36: C IFBK respectively.
37: C
38: C-----

39: C
40: C In this routine, users must set size of blocks of NBANK/NFBNK0 words
41: C used from optional bank arrays. Conversion to second array index for
42: C DBNK etc. is performed automatically in subroutine INTRO2.
43: C
44: C For example, if a user want to use attribute 11 of DBNK with size of
45: C 3*NBANK words (double) and attribute 13 of IFBK with size of
46: C NBANK* (NEST + 1) words (single), necessary coding in this routine is
47: C as follows:
48: C
49: C KDBNK(11) = 3
50: C KIFBK(13) = NEST + 1
51: C
52: C Index 11 to 16 of KDBNK, KIBNK, KDFBK and KIFBK are provided for
53: C custom use.
54: C
55: C=====

```
56: C include '../shared/INC/_IUNIT'  
57: C include 'INC/_SIZES'  
58: C include 'INC/_FLAGS'  
59: C  
60: C integer KDBNK(0:MDBNK)  
61: C integer KIBNK(0:MIBNK)  
62: C  
63: C integer KDFBK(0:MDFBK)  
64: C integer KIFBK(0:MIFBK)  
65: C
```

```
66: C-----  
67: C KDBNK(11) = 3  
68: C KIFBK(13) = NEST + 1  
69: C  
70: C return  
71: C end
```

65: C

```

```

66: C   You can use some utility routines for MVP/GMVP type free form inputs.
67: C   * FREADS routine to get data-name.
68: C   * I4READ, R4READ, R8READ & CHREAD to read data elements of
69: C     integer, real, double precision and string respectively.
70: C
71: C-----
72: C Description of utility routines:
73: C   ( arguments : i = input, o = output, c =constant, w = work )
74: C
75: C-----
76: C   SUBROUTINE FREADS( VNAME, NLEN, IEND )
77: C-----
78: C
79: C       Get next data-name from current input file.
80: C
81: C       o VNAME (character*(*)): data-name found.
82: C       o NLEN (integer): length of data-name found.
83: C       o IEND (integer): end of file encountered if not zero.
84: C
85: C-----
86: C   subroutine I4READ( VNAME,IA, NA,NB,IEND )
87: C   subroutine R4READ( VNAME,RA, NA,NB,IEND )
88: C   subroutine R8READ( VNAME,RA8,NA,NB, IEND )
89: C-----
90: C
91: C       Get numerical data of integer, real and double real type.
92: C       This routine must be called after "FREADS" succeeded in getting
93: C       a data-name.
94: C
95: C       i VNAME (character*(*)): data-name.
96: C       o IA(*),RA(*),RA8(*) : arrays to put data
97: C                             (integer, real , duple real)
98: C       o NA (integer) : number of data read in.
99: C       i NB (integer) : if NB > 0, NB is the number of data
100: C                       expected to be input.
101: C                       if NB < 0, no expected number of data
102: C                       but data over abs(NB)'th data
103: C                       are skipped.
104: C                       NB = 0 also means no expected number of
105: C                       data but not recommended to use.
106: C       o IEND (integer) : end of file encountered if not zero.
107: C
108: C-----
109: C   subroutine CHREAD( VNAME, CGET, CHAR, NLEN, ITERM, IEND )
110: C-----
111: C
112: C       Get a string data from current input file. This routine gets
113: C       only one non-blank string per call, so you may need to call
114: C       this routine repeatedly until a termination point is reached.
115: C
116: C       i VNAME (character*(*)): data-name.
117: C       o CGET (character*(*)) : a string input.
118: C       i CHAR (character*(*)) : list of termination characters
119: C                               other than blank. The most popular one is
120: C                               ' ' which terminates data sequence such as;
121: C                               data-name( str1 str2 ... strn )
122: C       o NLEN (integer) : length of string read in.
123: C       o ITERM (integer) : If non-zero, encountered a termination
124: C                           character CHAR(ITERM:ITERM).
125: C       o IEND (integer) : end of file encountered if not zero.
126: C

16: C=====
17: C PURPOSE: control routine or procedures to find zone/region from
18: C particle positions given in absolute coordinates.
19: C This is a miniature version of ACTION routine and should be used
20: C in zone/region/material dependent rejection sampling
21: C in source generation phase, etc.
22: C Obtained particle attribute data may not be used in the
23: C processes after this routine.
24: C
25: C << This routine cannot handle STG-region (lattice) >>
26: C return with IZZ1=0 and LPOS1(LEVL1)=-1
27: C
28: C CALLED IN: ABS2ZN
29: C CALLS      : JUDGE, LATDWN
30: C=====
31: C arguments (i=input, o=output, w=work)
32: C
33: C i IOW : message printout I/O unit
34: C io A(*) : dynamic memory area(task shared)
35: C io H(*) : dynamic memory area(task local)
36: C i JMODE : running mode.
37: C      0 : only returns zone numbers IZZ1 for each particle.
38: C
39: C Optional information is returned if specified bit is non-zero.
40: C
41: C bit 1 : returns region numbers in IBREG1.
42: C bit 2 : returns lattice geometry parameters on LEVL1, LZZ1,
43: C LPOS1, LCRS1, IBREG1 & IBSPC1.
44: C bit 3 : returns translated in-cell coordinates on X1,Y1,Z1.
45: C bit 4 : direction is given on A1,B1,C1 and returns translated
46: C in-cell directions on A1,B1,C1.
47: C
48: C i JDEBG : debug option flag
49: C i JLATT : lattice geometry used if non zero
50: C i JTLT : frame dependent tally mode if non zero
51: C i JHLAT : hexagonal lattice geometry used if non zero
52: C o ILOST : number of lost particles
53: C      (no message of lost particle in this routine)
54: C
55: C i(o) X1(NN), Y1(NN),Z1(NN) : absolute coordinates of the particles.
56: C i(o) A1(NN), B1(NN),C1(NN) : absolute coordinates of the particles.
57: C
58: C i MEMZN(NMEMZN) : "MEMZN" type of zone memory array.
59: C i JMEMZN : use MEMZN if non-zero.
60: C
61: C o IZZ1(NN), LEVL1(NN),LZZ1(NN,NEST),LPOS1(NN,NEST),LCRS1(NN,NEST)
62: C IBREG1(NN), IBSPC1(NN,0:NEST) : determined attributes.
63: C
64: C Arrays other than IZZ1 may not have actual memory area.
65: C They must have real memory area when return values are

```

```

66: C      required through JMODE option.
67: C
68: C      IZZ1 is set to negative when a zone is not found for
69: C the particle. set to zero when a zone is STG region.
70: C
71: C i NN : number of particles whose zones/attributes are determined
72: C i I1,I12 : X1(I1:I12),Y1(I1:I12) ... is processed in this routine.
73: C      I12-I1-1 must not exceed NBNK2. It is responsibility of routines
74: C calling this routine not to violate this rule.
75: C
76: C o IERR : error code
77: C
78: C i IPCEL(*), SDA(NSDA) ... : geometry data for JUDGE routine etc.
79: C
80: C w XXX,YYY,ZZZ,AAA,BBB,CCC,IZZ,LEVL,LZZ,LPOS,LCRS,IBREG,IBSPC :
81: C Temporary particle bank used within this routine.
82: C w LSEND(NBNK2) : temporary stack of "finished" particles
83: C w LSSRC,IZNXT,NNXT : temporary "NEXT ZONE SEARCH" stack.
84: C w LSLAT,IZLAT,NXLT : temporary lattice search stack.
85: C
86: C w X,Y,Z,IFI,IFL: working array of size NBNK2
87: C
88: C=====
89: C important common variables:
90: C NBNK2 : size of banks, stacks, working arrays for "underground" level
91: C modules.

13: C=====
14: C PURPOSE: Calculate distances to frame of lattice, from current
15: C lattice cell level to the 1st lattice level.
16: C Necessary to treat arbitrary shape of lattices and
17: C their overlap.
18: C
19: C Compare them with those to zone boundary,
20: C And calculate coordinates & directions in upper level.
21: C IFC = N/0 = CROSS THE FRAME/ NO CROSSING
22: C (N = ZONE NUMBER IN UPPER LEVEL)
23: C <<caution>>
24: C This routine cannot handle surface # of torus (IKL & IKL2)
25: C for SQSOL1 routine called in SPEAR1 routine.
26: C Torus should not be a surface to compose lattice frame.
27: C
28: C CALLED IN: FLIONE
29: C CALLS: SPEAR1
30: C-----
31: C Arguments ( i=input, o=output, w=work ) :
32: C (see description on COMMON undescribed ones)
33: C i IOW: message printout I/O unit.
34: C i MZONE: particles are in zone MZONE in current lattice level
35: C i NN : number of particles
36: C i JDEBG,NBANK,NEST,NLATT,NLBZ,NZONE,DINP,DEPS:
37: C
38: C i X(NN),Y(NN),Z(NN),AI(NN),BI(NN),CI(NN): position and directions
39: C i IBP(NN): bank pointers for X,Y,Z,AI,BI,CI,ILUP,ILST and DI.
40: C
41: C i o DI(NN) : distance to be calculated (minimum of distances to frame
42: C and incoming value to this routine.)
43: C o IFC : frame zone # if particle may reach frame boundary or zero.
44: C o XUP(NN),YUP(NN),ZUP(NN),AUP(NN),BUP(NN),CUP(NN):
45: C positions and directions in upper level.
46: C o ILUP(NN) : lattice frame level giving smallest distance.
47: C o ILST(NN) : set flag when particle is lost
48: C
49: C i LEVL(NBANK), LZZ(NBANK), LPOS(NBANK), LCRS(NBANK) :
50: C lattice-cell bank
51: C
52: C i o DBNK(NBANK,*),KDBNK(0:MDBNK),IBNK(NBANK,*),KIBNK(0:MIBNK):
53: C optional bank parameters.
54: C
55: C <<Parameters related to this routine>>
56: C
57: C IBNK(*,KIBNK(5)) : flight path count. Particles having
58: C zero value are processed in this routine.
59: C IBNK(*,KIBNK(6):KIBNK(6)+NEST-1) : lattice level giving
60: C the smallest distance each the level
61: C DBNK(*,KDBNK(4):KDBNK(4)+NEST+i-1) : distance to lattice frames
62: C of i'th level. i=NEST is reserved for
63: C some future extension.

126: C       CKLATT( strings ... )
127: C
128: C CELLSYMS is a list of one-character cell symbols corresponding
129: C with cell-ID list in CELIDS().
130: C CKLATT() contains cell-ID mapping in a lattice using cell

```

src/shared/lattin.f

```

131: C      symbols
132: C
133: C      ex.
134: C
135: C      CELLDIDS( 0 1 12 100 )
136: C      CELLSYMS( 0 1 A B )
137: C      CKLATT( BBBB BBBB
138: C              BAAA111AAAB
139: C              BAA00000AAB
140: C              BAA00000AAB
141: C              BAA00000AAB
142: C              BAAAAAAAAB
143: C              BBBB BBBB )
144: C
145: C      is identical to:
146: C
147: C      KLATT( 11(100)
148: C            100 12 12 12 1 1 1 12 12 12 100
149: C            100 12 12 0 0 0 0 0 12 12 100
150: C            100 12 12 0 0 0 0 0 12 12 100
151: C            100 12 12 0 0 0 0 0 12 12 100
152: C            100 12 12 0 0 0 0 0 12 12 100
153: C            100 12 12 12 12 12 12 12 12 100
154: C            11(100) )
155: C
156: C      Strings in CKLATT can be separated blanks or newline, and
157: C      only the order of characters in strings has meanings.
158: C      So users can use "broken" or "dense" forms as follows:
159: C
160: C      CKLATT( B B B B B B B B B B
161: C              B A A A 1 1 1 A A A B
162: C              B A A 00000 A A B
163: C              B A A 00000 A A B
164: C              B A A 00000 A A B
165: C              B A A A A A A A A B
166: C              B B B B B B B B B B )
167: C
168: C      CKLATT( BBBB BBBB BAAA111AAAB BAA00000AAB BAA00000AAB
169: C              BAA00000AAB BAAAAAAAAB BBBB BBBB )
170: C
171: C      Beware that the repetition or interpolation syntax usable for
172: C      numeric data is not allowed for character list input like
173: C      CELLSYMS and CKLATT.
174: C
175: C
176: C      A similar character mode input is possible for KSLAT as follows:
177: C      (from 18 Nov 1999)
178: C
179: C      CELLDIRS( cell-direction-indices )
180: C      DIRSYMS( one-character-cell-direction-list )
181: C      CKSLAT( strings ... )
182: C
183: C      ex.
184: C
185: C      CELLDIRS( 0 0 100 010 110 )
186: C      DIRSYMS( 0 A X Y M )
187: C      CKSLAT( XXXXX0AAAAA
188: C              XXXXX0AAAAA
189: C              XXXXX0AAAAA

631: C : get an index pointer to store numeric data( I4, R4, R8 ) as
632: C a packet.
633: C
634: C Data placement on the data area should be done afterwards
635: C and take care not to destroy data structure.
636: C This is useful for a case to place data directly from a file;
637: C
638: C ex:
639: C call packpt( packet, 'integer', 'R4', LP, 1000, IRET )
640: C if( IRET.eq.0 ) read(10) (packet(lp+i-1),i=1,1000)
641: C
642: C An index pointer for 'R8' data is returned as an index for
643: C PACKET(*) array declared as double word type.
644: C
645: C ex.
646: C
647: C real PACKET(100000)
648: C real*8 DPACKET(100000)
649: C equivalence (PACKET,DPACKET)
650: C ...

```

src/shared/packet.f

```

651: C      call packpt( packet, 'integer', 'R4', LP1, 1000, IRET )
652: C      if( IRET.eq.0 ) read(10) (PACKET(LP1+I-1),I=1,1000)
653: C      call packpt( packet, 'integer', 'R8', LP2, 200, IRET )
654: C      if( IRET.eq.0 ) read(10) (DPACKET(LP2+I-1),I=1,200)
655: C

5: C=====
6: C PURPOSE:  CALCULATION OF DISTANCES TO A ZONE BOUDARY.
7: C
8: C  Accept NN particles whose coordinate & direction data are stored
9: C  in arrays X,Y,Z, AI,BI  and CI sequentially.
10: C  Calculate distances to zone 'MZONE' and store them in array DI(*).
11: C
12: C  Array DI(I) should be initialized to DINF or other default value
13: C  in the calling routine, or it may not be possible to check a valid
14: C  distance is calculated or not.
15: C
16: C CALLED IN:  FLIONE,LATICE
17: C CALLS:     SOSQL1
18: C-----
19: C Arguments (i=input, o=output, w=work)
20: C i MZONE: zone #
21: C i KZDA, KZAA, SDA: zone geometry data (see description attached to
22: C   common /PGEOM/ ety.)
23: C i NN : number of particles
24: C i NBANK : size of arrays X,Y,Z,AI,BI,CI,DI ...
25: C i JSS : when non-zero, IKL2(*) must be set correctly as well for
26: C   bodies other than torus.
27: C i X(NBANK), Y(NBANK), Z(NBANK) : coordinates of particles
28: C i AI(NBANK), BI(NBANK), CI(NBANK) : direction vector of particles
29: C i DI(NBANK) : calculated distance to zone boundary
30: C w DLOC1(NBANK), DLOC2(NBANK) : working array used to keep intermediate
31: C   distance calculation result when "outside of a body" is used
32: C   in the definition of the zone.
33: C w DSAVE(NBANK) : working area used only when JSS.ne.0
34: C
35: C
36: C i IKL(NBANK) : surface pointer (to SDA) on which particle is
37: C   currently placed, if non-zero.
38: C   Used only when geometry definition includes torus.
39: C   Bank data KLSF(*) of each particle should be stored
40: C   in calling routine.
41: C
42: C o IKL2(NBANK) : surface pointer (to SDA) on which particle will be
43: C   placed if the calculated distance to a torus is
44: C   selected as smallest one in body list.
45: C
46: C   When JSS.ne.0, surfaces other than torus is memorized
47: C   as well, but for bodies used with minus sign (outer side)
48: C   the surface index may be for the last surface of the body,
49: C   so IKL2 data for such a case can be used only for
50: C   body detection and not for surface detection.
51: C
52: C i DINF : "infinite" distance. If no valid distance is calculated,
53: C   DI(*) is set to DINF.
54: C i DEPS : "minimum" distance.

31:     C=====
32:     C purpose: input records combination including data type, size etc.
33:     C           and long data are splitted into more than one record.
34:     C
35:     C this routine is called from the follwing interface routines:
36:     C
37:     C   SRECII : integer array
38:     C   SRECIR : real array
39:     C   SRECID : double precision real array
40:     C
41:     C called in: RESTRT
42:     C-----
43:     C Arguments ( i=input, o=output, w=work )
44:     C
45:     C i mtyp : data type -- 1/2/3 = integer/real/real*8
46:     C i iunit : I/O unit to input data
47:     C i ITSK  : task ID ( from 1 to NTASK )
48:     C           In message passing multi task mode (PVM,MPI), ITSK may differ
49:     C           from that of running task (IDTASK), and data transfer occur
50:     C           in such a case;
51:     C
52:     C <PVM/MPI mode>
53:     C   ITSK=IDTASK=1 : read & store data on IA/RA/DA
54:     C   ITSK>1,IDTASK=1 : read & send input data to task ITSK.
55:     C   ITSK>1,IDTASK=ITSK : receive from task 1 & store data on IA/RA/DA
56:     C
57:     C           In other modes, ITSK should be equal to IDTASK.
58:     C This routine should be called from a mutex (locked) block in
59:     C parallel mode other than message passing.
60:     C
61:     C i name   : data name labeled on record.
62:     C o IA(NA),RA(NA),DA(NA) : array on which input data are stored.
63:     C i NA     : length of array.
64:     C o IERR   : non zero value is retured if some error has occurred.
65:     C

31:     C=====
32:     C purpose: output records combination including data type, size etc.
33:     C and long data are splitted into more than one record.
34:     C
35:     C this routine is called from the follwing interface routines:
36:     C
37:     C SRECOI : integer array
38:     C SRECOR : real array
39:     C SRECOD : double precision real array
40:     C
41:     C called in: RESTO
42:     C-----
43:     C Arguments ( i=input, o=output, w=work )
44:     C
45:     C i mtyp : data type -- 1/2/3 = integer/real/real*8
46:     C i iunit : I/O unit to output data
47:     C i ITSK : task ID ( from 1 to NTASK )
48:     C In message passing multi task mode (PVM,MPI), ITSK may differ
49:     C from that of running task (IDTASK), and data transfer occur
50:     C in such a case;
51:     C
52:     C <PVM/MPI mode>
53:     C ITSK=IDTASK=1 : output data on file.
54:     C ITSK>1,IDTASK=1 : receive data from ITSK and output on file.
55:     C ITSK>1,IDTASK=ITSK : send data to task 1.
56:     C
57:     C In other modes, ITSK should be equal to IDTASK.
58:     C This routine should be called from a mutex (locked) block in
59:     C parallel mode other than message passing.
60:     C
61:     C i name : data name labeled on record.
62:     C i IA(NA),RA(NA),DA(NA) : output data array.
63:     C i NA : length of array.
64:     C o IERR : non zero value is returned if some error has occurred.
65:     C

11: C=<MVP/GMVP>=====
12: C  purpose: process "special" tally specifications - Stage 1;
13: C      compose IDTAL data etc.
14: C  called in: talin routine of mvp/gmvp.
15: C  calls : iorder,pctchk,iclen2,rwind,ibtile,reglst,cnterr,label,
16: C          unpkcs,unpknd,pctlb,ccomp,imatch,nid2nn,prstop
17: C=====
18: C  arguments ( i=input, o=output, w=work )
19: C i CODE   : name of code using this routine ('MVP'/'GMVP')
20: C i IOWK   : I/O unit number of working file (text) to store temporary
21: C            information for a succeeding process.
22: C o NERR   : number of errors
23: C io  A    : task shared dynamic data area used as "REAL" type.
24: C io  CHA   : task shared dynamic data area used as "CHARACTER*4" type.
25: C i IPK    : data packet container in which $TALLY block is stored.
26: C i RPK    : equivalent to IPK but in REAL type.
27: C i NPS    : size of "IPK" in words.
28: C i ITAL   : number of special tally entry in $TALLY input block.
29: C o IDTAL  : direct tally information.
30: C i NLTEMP : size of memory available to IDTAL ( actual size of IDTAL
31: C            is determined in this routine.)
32: C o NIDTAL : actual size of IDTAL array.
33: C o NDTALY : total number of direct-tally.
34: C o NETALY : total number of edited-tally.
35: C i JNEUT,JPHOT,JTIME,JFISS,JEIGN,JRESP,JTLLT,JDEBG : option flags
36: C i IDSRF(NTSRF) : ID of tally-surfaces
37: C o KE2D : reference of i-th ETALY to DTALY ( used for data processing)
38: C          if negative, tally-ID is stored.
39: C w IWRK : working array (integer)
40: C w RWRK : working array (real)
41: C w DWRK : working array (real*8)
42: C i NWORK : working array size in word.
43: C
44: C (iwr, rwrk & dwrk have the same address)

10: C=<MVP/GMVP>=====
11: C  purpose: process "special" tally specifications - Stage 2;
12: C           compose IETAL data etc.
13: C  called in: talinp routine of mvp/gmvp
14: C=====
15: C  arguments ( i=input, o=output, w=work )
16: C  i code   : name of code using this routine ('MVP'/'GMVP')
17: C  i iowk   : I/O unit number of working file (text) from which stored
18: C             data in preceding process are input.
19: C  i iowk2  : I/O unit number of working file (text) used in this
20: C             procedure.
21: C  o nerr   : number of errors
22: C  i ipk    : data packet container in which $TALLY block is stored.
23: C  i rpk    : equivalent to IPK but in REAL type.
24: C  i nps    : size of "IPK" in words
25: C  i ital   : number of special tally entry in $TALLY input block.
26: C  o ietal  : edited tally information.
27: C  i nltemp : size of memory available to IETAL ( actual size of IETAL
28: C             is determined in this routine.
29: C  o nietal : actual size of IETAL array. not set in this routine.
30: C  o ketal  : pointer to ETALY(*) array for each edited tally.
31: C  o jdtrg  : flag to show each region needs specified d-tally.
32: C  i nreg   : total number of region
33: C  i ndtaly : total number of direct-tally.
34: C  i netaly : total number of edited-tally.
35: C  o nedtmx : maximum length of edited tally
36: C  o kdatal : pointer to DTALY(*) array for each direct tally.
37: C  i idtal  : direct tally information.
38: C  i nidtal : actual size of IDTAL array.
39: C  o NLDOTAL : size of DTALY array
40: C  o NletAL : size of ETALY array
41: C  i NETRV  : Number of special (edited) tallies whose "real variance"'s
42: C             are estimated.
43: C  o METRV  : Total length of special (edited) tallies whose
44: C             "real variance"'s are estimated. (per batch length)
45: C  o IETRV(2,NETRV+1) : Pointers for special (edited) tallies whose
46: C             "real variance"'s are estimated.
47: C             IETRV(1,*) : edited tally #.
48: C             IETRV(2,*) : tally is stored on
49: C                   ETRV(IETRV(2,i):IETRV(2,i+1)-1,batch).
50: C  o JPUSD  : flag to show point detector really used.
51: C  i JNEUT,JPHOT,JTIME,JFISS,JEIGN,JRESP,JTLLT,JDEBG : option flags
52: C  i KE2D  : reference of i-th ETALY to DTALY ( used for data processing)
53: C             if negative, tally-ID is stored.
54: C  o KIDT  : starting position for each d-tally in IDTAL
55: C  o ndtwmx: maximum size of work area to peocess d-tally to e-tally
56: C             except NEDTMX.
57: C  w iwrk   : working array (integer)
58: C  w rwrk   : working array (real)
59: C  w dwrk   : working array (real*8)
60: C  i nwork  : working array size in word.
61: C
62: C (iwr, rwrk & dwrk have the same address)

6: c purpose: generation of source particle from user supplied source.
7: c
8: c << this is a skelton of user supplied source routine >>
9: c
10: c Users can add sampling statements to this routine.
11: c Examples are shown in subroutine SYSSRC.
12: c
13: c-----
14: c
15: c << arguments >>
16: c
17: c (usage symbol: i=input, o=output, io=input & output, w=work )
18: c
19: c i type : user supplied source type (character string as 'USER1')
20: c i ns : number of source particles to be generated
21: c io irand : seed of random number (INTEGER)
22: c i data : input data to specify users source property (REAL*8)
23: c i ndata : number of effective data elements stored in 'data' array
24: c w rwk : working array of type REAL dimensioned as rwk(ns,4)
25: c w iwk : working array of type INTEGER dimensioned as iwk(ns,4)
26: c        Rwk and iwk occupy identical memory area, so users
27: c        should take care in using them.
28: c
29: c Users must give values for all or part of the following parameters.
30: c
31: c Beware that users cannot specify kind of generated particles as
32: c neutron, photon etc., and cannot give energy group #'s directly in
33: c multigroup calculation.
34: c
35: c o x,y,z : source position (unit: cm)
36: c o a,b,c : direction cosines (a**2 + b**2 + c**2 = 1.0)
37: c o e : energy (unit: eV)
38: c o t : time (unit: second)
39: c o w : particle weight (ordinary = 1.0 without biasing)
40: c
41: c Users must set and return an error code as follows:
42: c
43: c o ierr : .eq. 0 if sampling succeeded.
44: c        .ne. 0 if any sampling errors occurred.
45: c
46: c
47: c << Random number generation >>
48: c
49: c Use of 'RANU2' routine is recommended to keep consistency with
50: c other parts of the code.
51: c
52: c call ranu2( irand, r, n, icode )
53: c
54: c irand : seed of random number (renewed after each call)
55: c r : array of type REAL to save random number(s)

136: C
137:   function IVARCK(ISCOPE,VNAME,TYP,X)
138: C=<MVP/GMVP>=====
139: C Purpose: check a scalar variable is registered with VARREG routine,
140: C   and return the registered value if any.
141: C
142: C Returns <scope> if specified variable is registered else returns -1.
143: C
144: C Called int (anywhere)
145: C history: Aug 1995 (M.Sasaki)
146: C=====
147: C arguments (i=input, o=output, w=work )
148: C i iscope : "Scope" is used to control the range of "visibility" of
149: C   registered variable. ISCOPE=0 means global visibility all over
150: C   the program.
151: C   iscope >= 0 :
152: C     Variable having a name "VNAME" is searched among registered
153: C     ones having scope value less than or equal to iscope.
154: C   iscope < 0 :
155: C     Variable having a name "VNAME" is searched among registered
156: C     ones having scope value equal to abs(iscope).
157: C i vname : name of scalar variable registered.
158: C i typ : variable type ( I4/R4/R8 = integer/single real/double real)
159: C o x : value of variable. This argument is declared as "integer"
160: C   array but the real data type on the calling side may be real or
161: C   double. Only the starting address has meanings here.
162: C   (ie. assuming argument passing convention of "by name".)

62: C Zero for non marker regions.
63: C MKREG(i,2): region # for i'th marker region.
64: C (NMKREG <= NREG, of course!!)
65: C

```

```

66: C* ... added 7 Feb 2000
67: C WFFACT R8 normalization factor of fission source weight calculated
68: C at the beginning of each batch (subroutine FISSET).
69: C
70: C* ... added Mar 2000
71: C NTSRF I4 number of surfaces for surface crossing tally
72: C ("tally surface")
73: C IDSRF(NTSRF) I4 surface ID list of tally surface.
74: C MTSRF I4 length of tally surface information array KTSRF(*)
75: C ITSRF(NTSRF+1,2) I4 pointer to KTSRF for each tally surface.
76: C See description of KTSRF.
77: C KTSRF(2,MTSRF) I4 tally surface composition data.
78: C this array stores pointers to surface data (SDA(*)) and
79: C other control information.
80: C
81: C Elements KTSRF(*,ITSRF(n,1):ITSRF(n+1,1)-1) are for surface n.
82: C KTSRF(*,ITSRF(n,1):ITSRF(n,2)|) is actual crossing surface
83: C and KTSRF(*,ITSRF(n,2)|+1:ITSRF(n+1,1)-1) compose psuedo-zone
84: C for clipping if |ITSRF(n,2)|<ITSRF(n+1,1)-1.
85: C Sign of ITSRF(n,2) shows that actual crossing surface is used
86: C as inside (+) or outside(-1) of a body.
87: C
88: C $ KTSRF(1,*) : pointer to surfaces
89: C $ KTSRF(2,*) : sign to surfaces
90: C $ KTSRF(1:2,*) works like KZDA(1:2,*) of zone definition.
91: C KTSFJ(MTSRF) I4 For surfaces composing tally-surface, surfaces
92: C having non-zero element are tallied-surfaces.
93: C Those having zero element are used only to "clip" actual
94: C tally-surfaces.
95: C Elements KTSFJ(ITSRF(n):ITSRF(n+1)-1) are for surface n.
96: C
97: C NANGLE I4 Number of angle tally bins.
98: C ANGLB(ANGLE+1) R8 Angle tally bin boundary (in cosine from angle 0
99: C to pai ).
100: c+beffl
101: C NEBEF I4 Number of event counter entries for beta-effective
102: C calculation.
103: c-beffl
104: c##<2007/03/14:PN3:
105: C
106: C INCSTPN(NUCPN,2) I4 list of photonuclear nuclide # for which
107: C "SPREAD" mode of special tally is specified, in
108: C INCSTPN(*,1).
109: C search index of (imt*100+nd) for microscopic response
110: C reactions, in INCSTPN(*,2).
111: C NNCSTPN I4 number of photonuclear nuclides for which "SPREAD" mode
112: C of special tally is specified. (maximum of nuclide #'s)
113: C
114: C MTMPN(NMTMPN) I4 list of reaction # using to microscopic photo-
115: C nuclear cross section.
116: C NMTMPN I4 total number of reaction # using to microscopic
117: C photonuclear.
118: c##>

59: C*
60: C NPKIND I4 Number of particle species in calculation.
61: C ( --> JNEUT + JPHOT )
62: C NPART I4/I8 Total number of particles (histories) in problem.
63: C ( includes previous histories of calculations in successive
64: C calculations by restart option. )
65: C negative input means running more '-NPART' histories

```

```

66: C in restart case. (in NO-RESTART case, abs(NPART) -> NPART)
67: C NHIST I4/I8 Number of particles (histories) run per batch.
68: C*** add 4 Feb 2000 ***
69: C NHSUB I4 Number of particles (histories) run per sub-batch.
70: C "Sub-batch" is a layer of history control of MVP/GMVP which
71: C compose a batch by processing NHSUB histories which is
72: C smaller than batch history size NHIST.
73: C*
74: C NBANK I4 particle bank length.
75: C*** add 14 Oct 1996 ***
76: C NBNK2 I4 working particle bank size use in "underground" level
77: C modules ( ABS2ZN routine etc.). Arrays of this level
78: C should not overlap with banks, working arrays etc. in
79: C routines directly called in ACTION routine.
80: C*
81: C NBPINT I4 interval to print intermediate monitoring results
82: C (K-eff, averaged source attributes etc.)
83: C If positive, monitor of every NBPINT'th batch is printed.
84: C If negative, print monitor batches including every
85: C abs(NBPINT)'th history. Default is 1.
86: C*
87: C NRSINT I4 Interval to output restart file.
88: C If positive, output after every NBPINT'th batch.
89: C If negative, output after batches including every
90: C abs(NBPINT)'th history.
91: C
92: C Output only after the last batch when zero.
93: C Non zero value is effective only in single task.
94: C Default is 0.
95: C*
96: C NTMINT I4 Interval to printout tally monitor.
97: C If positive, output tallies (K-eff or specified tally)
98: C after every NTMINT'th batch.
99: C Default is 10.
100: C*
101: C NGROUP I4
102: C For MVP,
103: C Sum of number of "energy group" for all particle species.
104: C This parameter is a
105: C number of energy bins for tallies or parameters
106: C which need an energy separation, and no relationship to
107: C the continuous cross section data itself.
108: C For GMVP,
109: C Total number of energy groups to be analyzed.
110: C It must be less than or equal to the number of energy group
111: C in cross section library.
112: C NZONE I4 Number of zones.
113: C NINPZ I4 Number of input zones.
114: C NBODY I4 Number of bodies.
115: C NBZL I4 Total number of body * sign input used to define zones
116: C NSURF I4 Total number of surfaces in geometry.
117: C NSDA I4 Length of surface data ('SDA' array)
118: C NZDA I4 Total number of (internal) zone-specification data
119: C NMEMO I4 Length of memorandum array (maximum number of memorized $
120: C $ next zones for each zone.)
121: C NMAT I4 Number of materials.
122: C NREG I4 Number of regions. "REGION"'s are defined as combination $
123: C $ of zones, and tallies for each batch are taken for "REGIONS"$
124: C $'s and variance-reduction parameters are defined also for $
125: C $"REGION"'s.
126: C Final output of tallies are done for "TALLY-REGION"'s$
127: C $ which can be combinations of 'REGION"'s.
128: C*
129: C NTIME I4 Number of time bins for tally <JTIME>
130: C***** NSECT I4 SECTOR NUMBER OF ZONE-DEPENDENT STACK

```

src/shared/INC/_SIZES

```
131: C NSOUR I4 Number of particle source sets. (not the number of source
132: C particles)
133: C NRESP I4 Number of response functions ( group-wise).
134: C NSTAL I4 Number of response functions ( continuous energy ).
135: C NRESP2 I4 Number of response functions (group-wise) used in STALY.
136: C NSTAL2 I4 Number of response functions (continuous energy ) used $
137: C $ in special tally.
138: C TCPU R4 Total cpu time allowed. (minuite)
139: C IRAND I4 Initial random number.
140: C NTHIST I4 Number of particles (histories) run so far in successive$
141: C $ runs. (counted by the code and stop calculation if
142: C NTHIST >= NPART).
143: C ECUT R4 Cutoff energy (eV) (lower energy boundary of calculation)
144: C TCUT R4 Cutoff time (sec)
145: C*SUPPLY R4 FACTOR OF SOURCE SUPPLY POINT ( 0.0 .GE. SUPPLY .LT.1.0 )
146: C*
147: C ELOOP R4 A threshold to terminate
148: C histories of "endless-loop" particles.
149: C
150: C $ SUM OF PROCESSED-PARTICLES IN DETECTION MODE
151: C $ When ----- > ELOOP
152: C $ SUM OF PROCESSED-PARTICLES IN THE BATCH
153: C NFBANK I4 Length of fission neutron bank in eigenvalue calculation.
154: C (actually, max size of stored data in fission bank)
155: C NFBANK0 I4 Actual length of fission neutron bank arrays.
156: C NSKIP I4 Number of batches skipped for tally $
157: C $in eigenvalue calculation.
158: C NBATCH I4 Number of batches run so far.
159: C NPICT I4 Number of pictures drawn <JPICT>
160: C NREFS I4 Number of reflection surfaces <JREFS>
161: C NMEMS I4 Maximum number of starting zones memorized for each$
162: C $ particle source set.
163: C NMEMOP I4 Optimize kmemo array while NBATCH .le. NMEMOP (default=2)
164: C*
165: C***** LATTICE RELATED SIZES < JLATT > *****
166: C*
167: C NLATT I4 Number of lattice.
168: C*NLLEV I4 Maximum geometry nesting level number.
169: C NCELL I4 Number of (lattice) cells.
170: C NEST I4 Maximum nest level in lattice geometry case.
171: C NLBZ I4 Number of lattice-buffer zones (in lattice cell and
172: C whose material is -999).
173: C
174: C NRSKIP I4 Number of random number skipped.
175: C < 0 : before each batch > 0 : before first batch only
176: C
177: C NLENG I4 Total number of batches in one or successive runs.
178: C (includes batches of the current run. To be set internally)
179: C*
180: C***** FOR PHOTON PROBLEMS ***
181: C*
182: C NGP1 I4 For MVP,
183: C Number of neutron energy groups (tally & source)
184: C For GMVP,
185: C Energy group number of primary particle to be analyzed.
186: C NGP2 I4 For MVP,
187: C Number of photon energy groups (tally & source)
188: C For GMVP,
189: C Energy group number of secondary particle to be analyzed.
190: C*
191: C***** FOR LATTICE OR FRAME DEPENDENT TALLY ****
192: C* (terminology "SUB-UNIVERSE" "SPACE" "SPACE-FAMILY" etc. are
193: C* replaced with "FRAME" "SUBFRAME" "SUBSPACE" etc in "JAERI data/code
194: C* 94-007" ( 7 Jun 1995 M.Sasaki )
195: C*
196: C NSPACE I4 Number of "subspace" defined to take tally separately for$
197: C $ zones in lattices or universes. <JLTTL>
198: C NUNV I4 Number of "frame"-input-zones which include geometric
199: C $ sub-structures such as lattice). <JLTTL>
200: C NSUZON I4 Number of "terminal"-zones which is defined as input-zones
201: C in lattice-cell and for which tallies can be taken (mat ID is
202: C non-negative) as regions in subspaces. <JLTTL>
203: C NCREG I4 Number of tally-regions specified in '#TALLYREGION'
204: C section of input data.
205: C NTREG I4 Total number of tally-regions.
206: C*** added Nov 1998
207: C NPNND I4 size of PNND array (nearest neighbour distribution for
208: C STG-region).
209: C*** added Aug 2003
210: C NPPPF I4 size of PPPF array (partial packing fractions in
211: C STG-region).
212: C*
213: C***** generation control for fixed source problem
214: C*
215: C*** added 23 June 1999 ***
216: C MXPGEN I4 particle generation cutoff used to prevent birth of
217: C too many children by fission and (n,gamma) reactions
218: C especially for fixed source problems with the RELATIVE-WEIGHT
219: C option.
220: C
221: C When MXPGEN > 0, birth of particles whose generation number
222: C from source particle is greater than MXPGEN is simply prevented.
223: C
224: C Ex. MXPGEN=2 allows birth of secondary neutron or photon,
225: C but doesn't allow tertiary particles.
226: C

11: C*
12: C NSTALY I4 Total number of "special" tallies. A "special" tally$
13: C $ is a tally specified in "$TALLY" section of input data$
14: C $ and taken separately from default tallies such as neutron$
15: C $ multiplication factor, region/group-wise flux etc. A special$
16: C $ tally can be time or angle dependent.
17: C $ A "special" tally is composed of one or more than one$
18: C $ "edited" tallies$
19: C $ which are combinations of$
20: C $ values tallied as the "special" tally in energy bins, time bins$
21: C $ etc. A "direct" tally$
22: C $ is a tally calculated on specified events in random walk process$
23: C $ and$
24: C $ "edited" tallies are calculated after each batch as combination$
25: C $ of "direct" tallies.
26: C
27: C NDTALY I4 Total number of "direct" tallies in all "edited" tallies.
28: C
29: C*
30: C DTALY(*) R8 Body of "direct" tallies. Positions and structures of each
31: C "direct" tally is stored in IDTAL array.
32: C NLDTAL I4 length of DTALY(*) array.
33: C
34: C IDTAL(NIDTAL) I4 Information of "direct" tallies;
35: C $ "Direct tallies" are tallies taken directly for random walk
36: C $ events, and "edited" tallies are composed from direct tallies
37: C $ and output as calculation results.
38: C $ Each direct tally has the following information;
39: C $ (array index is for each tally)
40: C $ IDTAL(1) : ID of "direct" tally (arbitrary)
41: C $ IDTAL(2) : garbage for debugging ( fixed to -999 )
42: C $ IDTAL(3) : starting address index of this direct tally
43: C $ in DTALY(*).
44: C $ IDTAL(4) : event # (see description of NTEVE)
45: C $ IDTAL(5) : particle type
46: C $ 1/2/3 = neutron/photon/...
47: C $ IDTAL(6) : number of dimensions of this direct tally.
48: C $ A direct tally is stored in memory as a matrix
49: C $ of IDTAL(6)-dimension.
50: C $ IDTAL(7) : weighting function specification.
51: C $ 0 = no weighting function is necessary.
52: C $ That means simple flux or current tally, and
53: C $ weights or track lengths multiplied by weight are
54: C $ tallied.
55: C $ 1000> N>1 : other special factor (not implemented now)
56: C $ -N : use N'th groupwise response function.
57: C $ 1001 : use microscopic cross section in SMIC (MVP)
58: C $ (calculate number density weighted rate)
59: C $ 1002 : use microscopic cross section in SMIC (MVP)
60: C $ ("spread" mode -> calculate per atom rate everywhere)
61: C $ 1003 : use microscopic photonuclear cross section in SMIC ! photo-nu
62: C $ (MVP) (calculate number density weighted rate) ! photo-nu
63: C $ 1004 : use microscopic photonuclear cross section in SMIC ! photo-nu
64: C $ (MVP) ("spread" mode -> calculate per atom rate ! photo-nu
65: C $ everywhere) ! photo-nu
66: C $ 2000 : (MVP) weighting function is from
67: C $ the special cross section data bank SGTAL(i,*).
68: C $ 3000 : use macroscopic cross section in SMAC (MVP/GMVP)
69: C $ 9001 : analog-event of scattering (MVP)
70: C $ 9002 : analog-event of capture (MVP)
71: C $
72: C $ IDTAL(8) : When IDTAL(7)=1001,1002 or 3000
73: C $
74: C $
75: C $ When SMIC is used as weighting factor.
76: C $ IDTAL(8) = 1024*m + n (n < 1024)
77: C $ Use SMIC(i,m,LMIC(n)) as factor ( m = nuc # )
78: C $
79: C $ When SMAC is used as weighting factor.
80: C $ IDTAL(8) = n
81: C $ Use SMAC(i,m,LMAC(n)) as factor ( m = material # )
82: C $
83: C $ When IDTAL(7) = 2000 , SGTAL(i,IDTAL(8))
84: C $
85: C $ IDTAL(9) : sequece # of this direct tally
86: C $ IDTAL(10) : custom tally # (non-zero means user customized
87: C $ tally treatment. Good boys/girls might not do
88: C $ such a dirty work ... but sometimes ...)
89: C $
90: C $ IDTAL(11) : detector # for point(next event) or surface tally
91: C $ When tally is surface tally, positive IDTAL(11) means
92: C $ tally for "particle current" and negative IDTAL(11)
93: C $ means "flux" tally.
94: C $
95: C $ IDTAL(12) to IDTAL(IDTOFF) : <unused>
96: C $
97: C $ The following data are prepared for each dimension of tally;
98: C $ ( "in" is offset from IDTAL(IDTOFF). zero for the first
99: C $ dimension). IDTOFF is a constant to specify length of
100: C $ "header" part of IDTAL for each tally
101: C $
102: C $ IDTAL(IDTOFF+in+1) : type of dimension:
103: C $ 0 : (unused)
104: C $ 1 : region
105: C $ 2 : energy
106: C $ 3 : time
107: C $ 4 : angle
108: C $ 5 : generation
109: C $ 6 : source set
110: C $ 7 : source-region
111: C $ 8 : marker-region
112: C $ 9 : spatial point
113: C $ 10 : produce-region ! photo-nuc
114: C $ 11 : produce-nuclide ! photo-nuc
115: C $ 12 : produce-reaction ! photo-nuc
116: C $ IDTAL(IDTOFF+in+2) : bin # of this dimension
117: C $ IDTAL(IDTOFF+in+3) : size of a table used for common bin # to
118: C $ tally bin # conversion.
119: C $ The "common bin #" is an integer particle attribute
120: C $ given independently of tallies or set for "basic" tallies
121: C $ such as energy group # in GMVP or region #.
122: C $ The time-dependent feature is possible only for
123: C $ special tallies, but a "common time bin set" is
124: C $ created by merging time bin sets of all direct-tallies,
125: C $ and "common bin #" is calculated independently of

```

src/shared/INC/_STALY

```

126: C $      direct tally events in time dependent problems.
127: C $
128: C $      The "energy group" in MVP has meanings only for
129: C $      tallies and direct tallies can have different energy
130: C $      divisions from the one for "basic" tallies, but such a
131: C $      possibility is reserved for future version and energy
132: C $      bin # of direct tallies in the current version is limited
133: C $      to combinations of energy bins of basic tallies.
134: C $
135: C $      Angle bins are probably highly dependent on each tally,
136: C $      so it is assumed that no "common angle bin #" is calculated.
137: C $      In such a case, this value is a negative number and its
138: C $      absolute value is pointer index to direct-tally
139: C $      dependent bin table (ITBIN(*)).
140: C $
141: C $      IDTAL(IDTOFF+in+4:IDTOFF+in+3+IDTAL(IDTOFF+in+3)) :
142: C $      Conversion table from common bin # to tally bin # of direct
143: C $      tally. ( IDTAL(IDTOFF+in+3) > 0 )
144: C $
145: C $      Ex. If there are 10 common energy bins and
146: C $      IDTAL(IDTOFF+in+4:IDTOFF+in+13) are given as;
147: C $      1 2 2 2 3 3 4 4 0 0
148: C $      common energy group 1 is bin # 1 of this d-tally,
149: C $      common energy groups 2, 3 and 4 are bin # 2,
150: C $      common energy groups 5 and 6 are bin # 3,
151: C $      common energy groups 7 and 8 are bin # 4,
152: C $      and common energy groups 9 and 10 are not tallied.
153: C $
154: C $
155: C $ ITBIN(*) I4 Tally bin information for direct tallies which does not
156: C $ use "common bin #" to tally bin # conversion table in IDTAL(*).
157: C $ This data may be used as real or double precision form using
158: C $ equivalent variable names RTBIN(*) <real> and DTBIN(*) <double>.
159: C $
160: C $ NIDTAL I4 Size of IDTAL array.
161: C $
162: C $ KDTAL(NDTALY+1) I4 starting position of each direct-tally in "DTALY"
163: C $ array. ( DTALY( KDTAL(i) : KDTAL(i+1)-1 ) is area for i'th tally).
164: C *
165: C * ... data for tally events
166: C *
167: C $ NTEVE I4 Number of Events to take "direct" tallies as "special" tally.
168: C $ ( "tally events" ) defined in TALINP
169: C $ Event #'s currently defined are as follows;
170: C $ 1 : Particle generation (source or gamma-generation or
171: C $      next event tally)
172: C $ 2 : Free flight
173: C $ 3 : Boundary/surface crossing
174: C $ 4 - 6 : (spare for future)
175: C $ 7 : leakage
176: C $ 8 : analog events of neutron for noise analysis
177: C $ 9 : analog events of photon for noise analysis
178: C $ 10 : neutron collision
179: C $ 11 : photon collision
180: C $ 12 : electron collision
181: C $
182: C $ The value of NTEVE is 12 in the current version.
183: C $
184: C $ JTEVE(NTEVE) I4 Number of "direct" tallies to be calculated on each
185: C $ tally event.
186: C $ KTEVE(*) I4 Pointers to IDTAL(*) array for each "direct" tally
187: C $ every tally event.
188: C $ This array is pointed by LTEVE(1:NTEVE) every tally event.
189: C $ LTEVE(NTEVE) I4 Pointers to KTEVE(*) array for each tally event.
190: C $ KTEVE(LTEVE(i):LTEVE(i)+JTEVE(i)-1) are pointers to IDTAL(*)

```

```

191: C      array for i'th tally event.
192: C $ JDTRG(NREG,NDTALY) I4 Flags to show that a "direct" tally
193: C $ should be taken in a region. ( for shortcut in tally procedure )
194: C $
195: C *****
196: C $
197: C $ NETALY I4 Total number of "edited" tallies in all "special" tallies.
198: C $ ETALY(*) R8 Body of "edited" tallies. Positions and structures of each
199: C $ "edited" tally is stored in IETAL data package.
200: C $ NLETAL I4 length of ETALY(*) array. Actual length is NLETAL*2.
201: C $ KETAL(NETALY+1) I4 starting position of each edited-tally in "ETALY"
202: C $ array. ( ETALY( KETAL(i) : KETAL(i+1)-1 ) is area for i'th tally).
203: C $ NEDTMX I4 maximum length of edited tally.
204: C $ RNM(NBINMX) C128 array to store character tally bin name (curently
205: C $      tally-region) for tally printout.
206: C $ NBINMX I4 maximum number of bins.
207: C $
208: C $ IETAL(NIETAL) I4 Information of "edited" tallies
209: C $ "Direct tallies" are tallies taken directly for random walk
210: C $ events, and "edited" tallies are compsed from direct tallies
211: C $ and output as calcualtion results.
