17: C=<MVP>=====
18: C PURPOSE: Tally for keff perturbation (NEUTRON)
19: C CALLED IN: NEUTR
20: C Copied from tally.f and modified by Y.Nagaya (1999/11/24)
21: C UPDATE:
22: C 06 Nov 2006: Add higher-order differential operator sampling method.
23: C               (Y.Nagaya)
24: C 11 Oct 2007: Add dummy arguments JBEFF, WWB, WSB, RNU.
25: C               Add beta-effective calculation with correlated sampling.
26: C               (Y.Nagaya)
27: C 12 Oct 2007: Fix a bug for perturbation calculation. (Y.Nagaya)
28: C               JPTTR(NREG,NPTDS) -> JPTTR(NREG,NPTDS+NPTCS)
29: C 23 Apr 2008: (Y.Nagaya) Modified the calculation scheme for
30: C               beta-effective calculation with correlated sampling.
31: C               The source weight for delayed neutrons are reduced.
32: C 01 Jun 2009: (Y.Nagaya) Implemented beta-effective calculation
33: C               capability with differential operator sampling.
34: C 30 Aug 2010: (Y.Nagaya) Extend the order of differential operator
35: C               sampling up to 8th.
36: C 28 Nov 2012: (Y.Nagaya) Implemented Lambda calculation capability
37: C               with differential operator sampling.

2:      &                  KDFBK, MDFBK, KIFBK, MIFBK )  
3: C=====
```

4: C PURPOSE: Optional particle bank reservation for custom use.
5: C CALLED IN: INTRO2
6: C CALLS:

7: C-----

8: C About optional data bank arrays:
9: C

10: C Particle attributes are stored in arrays XXX(1:NBANK) (X-coordinates)
11: C EEE(1:NBANK) (energy) etc. in MVP/GMVP and they are used for fixed
12: C purpose.
13: C MVP/GMVP version2.x and newer has arrays called "optinal bank data"
14: C used for any purpose and their data size may vary depending on
15: C problems to be solved or used in custom version by user.
16: C

17: C DBNK(1:NBANK,*) : double word bank array.
18: C IBNK(1:NBANK,*) : integer bank array.
19: C DFBK(1:NFBNK0,*) : double word bank array for fission neutron in
20: C eigenvalue calculation mode.
21: C IFBK(1:NFBNK0,*) : integer bank array for fission neutron in
22: C eigenvalue calculation mode.
23: C

24: C Array KDBNK(*) is used to point specified optinal attributes in
25: C array DBNK like DBNK(*,KDBNK(1)). Some elements of KDBNK(*) have
26: C meanings defined by developer as:
27: C

28: C DBNK(*,KDBNK(1)) is particle weight on birth,
29: C DBNK(*,KDBNK(2)) is time of birth,
30: C ...
31: C

32: C and elements KDBNK(11) to KDBNK(16) are for custom use and users can
33: C give any attributes in their custom version.
34: C

35: C KIBNK, KDFBK and KIFBK works in similar way for arrays IBNK, DFBK and
36: C IFBK respectively.
37: C

38: C-----

39: C

40: C In this routine, users must set size of blocks of NBANK/NFBNK0 words
41: C used from optional bank arrays. Conversion to second array index for
42: C DBNK etc. is performed automatically in subroutine INTRO2.
43: C

44: C For example, if a user want to use attribute 11 of DBNK with size of
45: C 3*NBANK words (double) and attribute 13 of IFBK with size of
46: C NBANK* (NEST + 1) words (single), necessary coding in this routine is
47: C as follows:
48: C

49: C KDBNK(11) = 3
50: C KIFBK(13) = NEST + 1
51: C

52: C Index 11 to 16 of KDBNK, KIBNK, KDFBK and KIFBK are provided for
53: C custom use.
54: C

55: C=====

56: C include './shared/INC/_IUNIT'
57: C include 'INC/_SIZES'
58: C include 'INC/_FLAGS'
59: C

60: C integer KDBNK(0:MDBNK)
61: C integer KIBNK(0:MIBNK)
62: C

63: C integer KDFBK(0:MDFBK)
64: C integer KIFBK(0:MIFBK)
65: C

```
66: C-----  
67: C KDBNK(11) = 3  
68: C KIFBK(13) = NEST + 1  
69: C  
70: C return  
71: C end
```

65: C
```

```
66: C   To customize , remove the following lines and add your own procedure.
67: C
68: C   Hints for customization:
69: C
70: C   You can use some utility routines for MVP/GMVP type free form inputs.
71: C   * FREADS routine to get data-name.
72: C   * I4READ, R4READ, R8READ & CHREAD to read data elements of
73: C     integer, real, double precision and string respectively.
74: C
75: C-----
76: C   Description of utility routines:
77: C   ( arguments : i = input, o = output, c =constant, w = work )
78: C
79: C-----
80: C   SUBROUTINE FREADS( VNAME, NLEN, IEND )
81: C-----
82: C
83: C       Get next data-name from current input file.
84: C
85: C       o VNAME (character*(*)): data-name found.
86: C       o NLEN (integer): length of data-name found.
87: C       o IEND (integer): end of file encountered if not zero.
88: C
89: C-----
90: C   subroutine I4READ( VNAME,IA, NA,NB,IEND )
91: C   subroutine R4READ( VNAME,RA, NA,NB,IEND )
92: C   subroutine R8READ( VNAME,RA8,NA,NB,IEND )
93: C-----
94: C
95: C       Get numerical data of integer, real and double real type.
96: C       This routine must be called after "FREADS" succeeded in getting
97: C       a data-name.
98: C
99: C       i VNAME (character*(*)): data-name.
100: C       o IA(*),RA(*),RA8(*) : arrays to put data
101: C                             (integer, real , duple real)
102: C       o NA (integer)       : number of data read in.
103: C       i NB (integer)       : if NB > 0, NB is the number of data
104: C                             expected to be input.
105: C                             if NB < 0, no expected number of data
106: C                             but data over abs(NB)'th data
107: C                             are skipped.
108: C                             NB = 0 also means no expected number of
109: C                             data but not recommended to use.
110: C       o IEND (integer)     : end of file encountered if not zero.
111: C
112: C-----
113: C   subroutine CHREAD( VNAME, CGET, CHAR, NLEN, ITERM, IEND )
114: C-----
115: C
116: C       Get a string data from current input file. This routine gets
117: C       only one non-blank string per call, so you may need to call
118: C       this routine repeatedly until a termination point is reached.
119: C
120: C       i VNAME (character*(*) ) : data-name.
121: C       o CGET (character*(*) ) : a string input.
122: C       i CHAR (character*(*) ) : list of termination characters
123: C                             other than blank. The most popular one is
124: C                             ')' which terminates data sequence such as;
125: C                             data-name( str1 str2 ... strn )
126: C       o NLEN (integer)         : length of string read in.
127: C       o ITERM (integer)        : If non-zero, encountered a termination
128: C                             charcater CHAR(ITERM:ITERM).
129: C       o IEND (integer)         : end of file encountered if not zero.
130: C

206: C JSTGR I4 Problem with STG region (to be set internally)
207: C*** added Oct 1999
208: C JAMXC I4 ADAPTIVE-MICRO-CALCULATION :
209: C      Do not calculate micro cross section of all nuclides after
210: C      collision, but calculate micro cross section of nuclides
211: C      when they are necessary for macro cross section calculation
212: C      etc.
213: C*** added 9 Apr 1999
214: C JANLF I4 ANALOG-FISSION : NO
215: C      if JANLF=1, automatically set
216: C      JFIXD=1, JEIGN=0, JFISS=1,
217: C      no effective in GMVP now.
218: C*** added 7 Jul 1999
219: C JPTIM I4 PERIODIC-TIME : NO
220: C      effective only when if JTIME=1.
221: C*** added 25 Nov 1999
222: C JPSTD I4 POINT-DETECTOR : NO
223: C*** added 3 Feb 2000
224: C JSTPR I4 SUBTASK-PRINT
225: C      printout from subtask in multi-task mode.
226: C
227: C      JSTPRN(1) : for printout in input/preparation phase.
228: C
229: C      0: throw away all printout.
230: C      1: print warning/error message (I/O unit IMSEG) but throw away
231: C      other printout. (default in MPI/PVM)
232: C      2: print all printout. (default in multi-thread mode)
233: C      -1: same as 1 but append to printout of main task
234: C      (currently unsupported)
235: C      -2: same as 2 but append to printout of main task
236: C      (currently unsupported)
237: C
238: C      JSTPRN(2) : for printout in random walk phase.
239: C      (currently no control is effective)
240: C
241: C      Option value has the same meaning with SUBTASK-PRINT(1).
242: C      Default is SUBTASK-PRINT(2)=2 (print all)
243: C*** added Mar 2000
244: C JTSRF I4 Use surface crossing tally
245: C*** added Apr 2000
246: C JKPAR(MKPAR) I4 specified particles are treated in current
247: C      calculation if non-zero.
248: C*** added Oct 2000
249: C JFMUL I4 Option for fission multiplicity.

20: C -----
21: C
22: C 1987:
23: C     First internal version was programmed on the FACOM VP-100 super-
24: C computer.
25: C     Most of cross section processing part was borrowed from
26: C MORSE-DD code (JAERI 1214, 1988).
27: C 1988-1989:
28: C     Lattice geometry capability useful for reactor core analysis etc.
29: C 1989:
30: C     Continuous energy version was created as the MVP code.
31: C 1991:
32: C     Point detector.
33: C 1993:
34: C     Modified as a multi-platform code which runs on many UNIX systems
35: C as well as the FACOM VP supercomputer on which this code had been
36: C developed.
37: C 1994:
38: C     Opened for public use as GMVP version 94.1.
39: C 1995:
