11: C
12: C=====
13: C Purpose: draw scan pathes.
14: C
15: C Comment for arguments and others:
16: C
17: C (It is not a full description of arguments and writer of this comment
18: C (M.Sasaki) might not be perfectly understanding what an anonymous
19: C programmer of original code was going to do ...)
20: C
21: C *arguments:
22: C
23: C N1, N2: particles pointed by index LSFFL(I), I = N1 to N2, are drawn
24: C whose flight pathes.
25: C
26: C Flight particle stack LSFFL(*), IZFFL(*) and NFFL(1:NZONE+1) is
27: C used to specify particles, but contents of it may not be the
28: C actual "in-flight" particle (for example, particle entered
29: C "reflector" or "outer void" zone.)
30: C
31: C N3 : in "boundary drawing" mode (STYLE=1), LSFFL(I), I =1 to N3
32: C is checked.
33: C
34: C *Bugs (not all of them):
35: C
36: C *Boundary drawing mode by STYLE=1 has not been working correctly
37: C after modification for version3.0 by M.Sasaki, and he has currently
38: C no power or will to correct it (sorry :-)).
39: C He hopes using STYLE=0 and STYLE2=1 be a remedy for this bug.

1: C
2: C=====
3: C   JAEA CGVIEW-SLICE VERSION 3
4: C=====
5: C
6: C   CGVIEW_SLICE is a tool to draw 2D slice images of MVP/GMVP's
7: C   3D geometry.
8: C
9: C   * Version 1 developed on the ancient OpenWindows of Sun Microsystems,
10: C   with a splended Graphical User Interface which needs a paper manual
11: C   in your hand every time you use it ;- ) and many orphan
12: C   processes were remained after it crashed !!!
13: C   (and often it crashed...)
14: C
15: C   * In version 2, graphics was changed to pure X-Window for portability,
16: C   and enabled output in PostScript form.
17: C   The G.U.I. is cleverly removed.
18: C
19: C   * In version 3, (Jan 1998)
20: C
21: C   Line tracking core routines are synchronized with newest
22: C   ones in MVP/GMVP source, and new features such as
23: C   STGM region and free lattice frame and many commands convenient for
24: C   interactive (but non-GUI!!) use are supported.
25: C
26: C   =====
27: C   Apology for version 3
28: C   =====
29: C
30: C   Some comments are added to obscure parts in the code by M.Sasaki,
31: C   a hacker of CGVIEW V3, but they may not match what anonymous
32: C   programmers of version 1 and 2 had been going to do, because
33: C   no documents or valuable comments are given to the hacker ....
34: C
35: C   Anyway, this code includes tons of misleading and buggy codings ;- ).

1:      subroutine BROADN( NPMAX, IMAXD, IMAXX, IADDMX,XCCOLD,DCOLD,
2:      &                  XCHOT, XCSAVE,ECOLD, YCOLD, EHOT,  ESAVE,
3:      &                  WBROAD,IVPOP )
4: C=<ARTCORE>=====
5: C Purpose :
6: C
7: C   given a cross section that is described by a table of cross
8: C   section vs. e and linear-linear interpolation between points
9: C   this routine will exactly doppler broadening the cross
10: C   section at a portion of the energies (one, two or three pages).
11: C
12: C   input parameters
13: C   cold1=index to first point loaded in core.
14: C   cold2=index to last point loaded in core.
15: C   cold1p=index to first point to use in doppler integration
16: C   cold2p=index to last point to use in doppler integration
17: C   the pairs (cold1,cold2) and (cold1p,cold2p) will differ
18: C   only if there is an unresolved resonance present.
19: C   hot1 =index to first point to broaden.
20: C   hot2 =index to last point to broaden.
21: C   ycold =table of speeds corresponding to xcold.
22: C   xccold =table of cross sections at initial temperature.
23: C   dcold=slope between points in (ycold,xcold) table.
24: C   ehot =table of energies corresponding to xchot (and xcold).
25: C   xchot =table of cross sections broadened to temp.
26: C   alpha =doppler width (11505.3*awr/tempef)
27: C
28: C   the table of points (cold1p,cold2p) is used to broaden the
29: C   table of points (hot1,hot2).
30: C
31: C   if there are 6012 (3 pages) or fewer data points all doppler
32: C   broadened cross sections will be calculated in one pass through
33: C   this routine. if there are over 6012 points the data will be
34: C   doppler broadened a page at a time. an exception is that at the
35: C   beginning of the section the first two pages will be broadened
36: C   in one pass and at the end of the section the last two pages will
37: C   be doppler broadened.
38: C
39: C   normally all of the points loaded into core will be used in the
40: C   doppler integration, i.e. cold1p=cold1 and cold2p=cold1p. however
41: C   if the three pages of data that are in core contain any portion of
42: C   the unresolved resonance region the doppler integration will be
43: C   cut off at the edge of the unresolved region and the cross section
44: C   will be extended from that point as 1/v. in this case for data
45: C   points at energies less than the unresolved resonance region
46: C   cold2p will point to the lower energy limit of the unresolved
47: C   region and cold1p will point to the first point in core. similarly
48: C   for points above the upper energy limit of the unresolved region
49: C   cold1p will point to the upper energy limit of the unresolved
50: C   region and cold2p will point to the last point loaded in core.
51: C   within the unresolved energy range the original data point will
52: C   just be copied without doppler broadening and cold1p and cold2p
53: C   are not used.

6: C=<ARTCORE>=====
7: C Purpose :
8: C   This routine is designed to doppler broaden one endf/b section
9: C   of data (i.e., one reaction). Data is read, doppler broadened and
10: C   output in the endf/b format. If the section contains 6012 or fewer
11: C   points the entire operation is performed in core. If the section
12: C   contains more than 6012 points the data will be broadened a page
13: C   (1 page = 2004 points) at a time, written to scratch and after the
14: C   entire section has been broadened it will be read back from
15: C   scratch and output in the endf/b format.

3:      &      NPMAX, XCCOLD,DCOLD, YCOLD )
4: c
5: c      this routine is scalar version of subroutine broads
6: c
7: c      high energy doppler broadening routine. this routine will
8: c      be used to doppler broaden all cross sections at energies
9: c      where ae/kt is greater than one million. any point with a lower
10: c      energy will already have been doppler broadened by routine
11: c      broadl or broadh.
12: c
13: c      for ae/kt less than or equal to 16 both exponentials in the
14: c      doppler broadening kernel must be considered. for higher energies
15: c      the second exponential may be ignored, which simplifies the
16: c      doppler broadening.
17: c
18: c      for ae/kt greater than 1,000,000 it is possible to assume the
19: c      term (x/y)**2 in the doppler integral is just unity (since x only
20: c      varies from y-4 to y+4, for y greater than 1000 this term is
21: c      essentially constant since it varies from (996/1000)**2 to
22: c      (1004/1000)**2.= 1.0 +/- 0.008.
23: c
24: c      the routine has been designed with no subroutine calls
25: c      in order to minimize running time. the arithmetic
26: c      statement functions ration(a) and erfc(r,experf) will
27: c      be compiled as in line coding by virtually any fortran
28: c      compiler, and as such do not represent function calls.

16: C=<MVPBURN>=====
17: C Purpose : Calculate number density change from burnup step SID1 to
18: C           SID2. Here SID1 and SID2 are burnup step IDs.
19: C
20: C   SID1 : get flux, reaction rates etc. from MVP calculation
21: C   SID2 : calculate new number density of this step.
22: C   SID0 : "old" number density is get from this step.
23: C           Normally SID0=SID1, but in the second substep of PC method
24: C           SID0= step i and SID1 = step i+1/2
25: C
26: C   NOWSTP (common) : current step # (counted from 1)
27: C   JPC : if non zero current step is calculated by PC method.
28: C   ISPC : for PC method, ISPC=1 is step NOWSTP --> NOWSTP+1/2
29: C           ISPC=2 is step NOWSTP --> NOWSTP+1
30: C           for non-PC case, ISPC=1.

2: C=====
3: C PDS UTILITY ROUTINE to open/close "virtual" member.
4: C
5: C A "virtual" PDS member is an arbitrary text or binary file
6: C created in a PDS directory using naming rule similar to ordinary
7: C PDS members.
8: C
9: C This type of member cannot be accessed by "READ" or "WRITE" mode
10: C of PDSIO routine. "SEARCH" and "DELETE" operations are possible
11: C if the file is not OPEN.
12: C
13: C To get the full path name of the file, users can use PDSNM routine.
14: C
15: C
16: C Mode:
17: C
18: C OPEN : open virtual PDS member on I/O unit IUNIT as read/write
19: C mode.
20: C WRITE : open virtual PDS member on I/O unit IUNIT as write
21: C mode.
22: C READ : open virtual PDS member on I/O unit IUNIT as readonly file.
23: C CLOSE : close PDS. Doing nothing in UNIX.
24: C
25: C DIRNAM, MEM1 : PDS directory and member name.
26: C
27: C FORM : 'TEXT' or 'BINARY' ('T' or 'B' is effective)
28: C
29: C IUNIT : I/O unit of the file. Must be given by caller.
30: C
31: C IOUT : message output I/O unit.
32: C
33: C IERR : return code.
34: C
35: C =0 : succesfully opened or closed
36: C =1 : I/O unit is already opened in OPEN mode
37: C or closing unoped I/O unit in CLOSE mode.
38: C =2 : failed to open/close the file
39: C =4 : invalid mode
40: C =8 : unsupported file form

2: C
3: C Automatic file open/close function ( for UNIX systems )
4: C
5: C =====
6: C
7: C Interpret an input-character-string
8: C and open appropriate file by specified I/O unit number.
9: C
10: C string = /n[control characters][:file-name]
11: C
12: C where;
13: C
14: C n = I/O unit number (always necessary. 1 to 99)
15: C
16: C control-characters:
17: C
18: C < FORM parameter >
19: C
20: C n or U : open as an unformatted (binary?) file
21: C (default)
22: C
23: C f or F : open as a formatted (text) file
24: C
25: C < STATUS parameter >
26: C
27: C Default status is 'UNKNOWN'.
28: C
29: C s or S : scratch file (deleted on close operation)
30: C When an existing file name is specified, does
31: C not delete the file.
32: C
33: C r or R : Read only ('OLD' status)
34: C
35: C n or N : New file.
36: C
37: C When both control characters and filename are omitted,
38: C open an scratch file.
39: C
40: C Examples:
41: C
42: C /41:keno67.lib (or /41U:keno67.lib )
43: C
44: C ---> open file keno67.lib as unformatted file on unit 41
45: C
46: C /7F:text.dat
47: C
48: C ---> open file text.dat as formatted file on unit 7
49: C
50: C /10s or /10
51: C
52: C ---> open a scratch file on unit 10
53: C

43: C
44: C      specification : specification characters string given to a
45: C                       parameter name in 'SET' command (described below).
46: C
47: C
48: C      (Order of intensity is .NOT. > .AND. > .OR. .)
49: C
50: C * Expressions are continued to the next C/# line by '&'.
51: C   (yet not in use)
52: C
53: C * Expressions are finally translated 'ON' or 'OFF' status
54: C   as follows;
55: C
56: C 1. expression := parameter-name, 'ON' if parameter-name is set
57: C    by SET command (described below) else 'OFF'.
58: C
59: C 2. expression := parameter-name( specifications ), 'ON' if
60: C    the parameter-name is 'ON' and is given
61: C    specific-characters which match at least one
62: C    specification-characters in '(specifications)'.
63: C
64: C Parameters and specifications in expression can include wildcard
65: C characters '*' and '?' any times. An '*' can matches any strings
```

```
66: C      including null string, and a '?' matches any one character.
67: C
68: C * IF ... ENDIF(ELSE) or ELSEIF ... ENDIF (ELSE) blocks can be
69: C   nested. ( upto 'MAXNST' levels )
70: C
71: C
72: C
73: C -----
74: C 2. How to set parameters, file names etc. with ASSIM commands.
75: C -----
76: C
77: C ASSIM can interpret the following commands;
78: C
79: C      SET, UNSET, INPUT, OUTPUT, SOURCE, DIRECTIVE, MONITOR
80: C
81: C These commands are put on standard input (or between source lines
82: C for SET,UNSET and DIRECTIVE).
83: C
84: C * Parameter names or specifications are given in source files or
85: C   given from standard input by the following commands..
86: C
87: C      [C/#]SET  parameter-name[(specification-strings)]
88: C      [C/#]UNSET parameter-name[(specification-strings)]
89: C
90: C * Filenames of input source program or processed output source file
91: C   can be given with the following commands;
92: C
93: C      INPUT  input-file <standard input only>
94: C      OUTPUT output-file <standard input only>
95: C
96: C * Program source can be given in standard input stream after
97: C   'SOURCE' command.
98: C
99: C      SOURCE <standard input only>
100: C      .... fortran source lines to the end of the input stream ...
101: C
102: C * Specify "directives" on line-head that should be remain unchanged
103: C   in activation of 'ON' status lines. Effective only directives
104: C   having '*' charcter on the first column.
105: C
106: C      [C/#]DIRECTIVE directive
107: C
108: C << Rules for ASSIM commands >>
109: C
110: C * 'C/#' on top of a line is necessary in fortran source.
111: C * '(specification-characters)' are optional.
112: C * 'SOURCE' can be used only in standard input and means that
113: C   inputs after this command are source lines and source input
114: C   other than standard input is ignored.
115: C * 'SET' command sets status of parameter-name 'ON' and gives
116: C   specification characters to the parameter-name if specified.
117: C   'SET' can be used more than once for the same parameter-name.
118: C * 'UNSET' command sets status of parameter-name 'OFF' if no
119: C   specifications are given or parameter-name is not set
120: C   previously.
121: C   When specifications are given in the 'UNSET' command,
122: C   the specifications are removed from the parameter-name if the
123: C   specifications are given previously with 'ON' status,
124: C   otherwise no change on parameter status & specification.
125: C
126: C Parameter names or specication strings are non-blank character
127: C strings whose lengthes are less than 'MAXLEN' (parameter defined
128: C in this program).
129: C
130: C * select I/O unit of monitoring output by MONITOR command;
```

src/tools/fat.f

```
131: C
132: C      MONITOR   I/O-unit
133: C
134: C      Default monitoring output is I/O unit 0 (standard error for most
135: C      UNIX systems but In HP-UX, standard output is unit 7.)
136: C      Cannot specify unit 5,6,10 or 20 for monitoring.
137: C
138: C      In source lines 'C/# SET', 'C/# UNSET' and 'C/# DIRECTIVE' can be
139: C      under control of 'C/#IF', 'C/#ELSEIF', 'C/#ELSE' and 'C/#ENDIF'
140: C
141: C -----
142: C 3. How does this program work.
143: C -----
144: C
145: C 1. Interpret 'SET' or 'UNSET' command from standard input or in
146: C    a fortran source (on unit 10 or specified by 'INPUT' command).
147: C
148: C 2. When 'IF', 'ELSEIF' command line is encountered, evaluate
149: C    expression and activate the following block if result is 'ON'
150: C    or deactivate if result is 'OFF'.
151: C
152: C    <Activation>      Replace '*' character on the first column
153: C                      with a blank. If a character other than a numeric character or a
154: C                      blank is on the second column and the first column is '*',
155: C                      remove the first column and shift the line to the left by one
156: C                      column ( this is for the case that the source block includes
157: C                      compiler directives headed by '$' '@' '*' etc.)
158: C
159: C    <Deactivation>   Replace a blank character on the first column of
160: C                      lines in the source file with '*'. When the first column is
161: C                      neither 'c', 'C' nor a blank, shift the line to the right by one
162: C                      column and '*' is placed on the first column (to save compiler
163: C                      directives).
164: C
165: C -----
166: C 4. Input & Output
167: C -----
168: C
169: C *Standard input :
170: C
171: C      * 'SET', 'UNSET' commands.
172: C      * 'INPUT', 'OUTPUT' commands.
173: C      * 'DIRECTIVE' command.
174: C      * Fortran source after SOURCE command line.
175: C
176: C *Source input :
177: C
178: C      I/O unit 10. ( or specified by 'INPUT' command )
179: C
180: C      ASSIM command with 'C/#' on line-head.
181: C
182: C      * 'IF', 'ELSE', 'ELSEIF', 'ENDIF'
183: C      * 'SET', 'UNSET' commands.
184: C      * 'DIRECTIVE' command.
185: C
186: C *Source output :
187: C
188: C      I/O unit 20. ( or specified by 'OUTPUT' command )
189: C
190: C *Standard output :
191: C
192: C      The total number of activated or deactivated lines is output.
193: C      Users can use this value to overwrite original source file by
194: C      the processed source files.
195: C
```

```
196: C      Ex.1 (HP-UX with C-shell, command input is HP.set)
197: C
198: C      echo 'SET SYSTEM(HP9000)' > HP.set
199: C      echo 'SET ROUNDOFF(NEAREST)' >> HP.set
200: C      echo 'UNSET ARGSAVE' >> HP.set

1:      program SPLIT
2:      C
3:      C =====
4:      C   Routine splitter for FORTRAN source file
5:      C
6:      C * Made by M.Sasaki (by modification of PSTOPO program by himself):
7:      C
8:      C -----
9:      C   Motivated by intolerable awkwardness of the 'fsplit' of HP-UX !!!
10:     C -----
11:     C
12:     C $Id: myfsplit.f,v 1.8 1999/10/07 08:41:05 sasaki Exp sasaki $
13:     C
14:     C =====
15:     C
16:     C Rules & Comments:
17:     C
18:     C
19:     C   * Splitted into current directory if '-d directory' option
20:     C     is not specified.
21:     C   * Splitted routines are named as NAME.f.
22:     C     NAME is upper case by default. (-i : option for names
23:     C     in lower case )
24:     C   * Block data routine are named as BLOCKn.f as default,
25:     C     where 'n' is sequence number of appearance of block data's.
26:     C     ( -b blk : options to change default BLOCK prefix to blk.)
27:     C   * Output message on the top of splitted files.
28:     C     (Original file, date & time ).
29:     C     Can be suppressed by -n option.
30:     C
31:     C Restrictions :
32:     C
33:     C   * Executable on HP-UX or other sysytems having command line
34:     C     parameter passing methods to FORTRAN program (by minor
35:     C     modification, I hope ).
36:     C   * SUBROUTINE, FUNCTION or BLOCKDATA symbol must be in a line.
37:     C     Subprogram name must be in the same line as SUBROUTINE
38:     C     etc. (continuations for arguments are possible)
39:     C   * Number of lines contained in a routine must be less than
40:     C     MAXL (parameter).
41:     C
42:     C Bug :
43:     C
44:     C   * Why this program is written by Fortran .....
45:     C
46:     C -----

517: C   PURPOSE: GET A NUCID & FILE NAME DATA FROM CROSS SECTION INDEX FILE.
518: C   CALLED FROM: FALOC, FALOCF
519: C   HISTORY: PROGRAMMED BY M.SASAKI (3 APRIL 1992)
520: C   UPDATE:

```

src/tools/nlb2txt.f

```

521: C 10 JUN 1993 : skip blank lines in index file.
522: C 13 AUG 1993 : get pathname of index file for use as default 'PATH'
523: C           for UNIX.
524: C 20 Apr 1994 : Correction for file name composition procedure (do
525: C           not add path to filenames with absolute pathname).
526: C           The head of filename in indexfile is LINE(IS:IS) and is not
527: C           file(1:1).
528: C 22 Jul 1996: enable MS-DOS type directory separation character '\'
529: C           as CHAR(92).
530: C 18 May 1997: enable MacOS type directory separation character ':'
531: C 14 Jul 1997: enable relative path name for "PATH" line.
532: C           Subroutine GTPATH is created to extract directory path of
533: C           a file opened on an I/O unit.
534: C 5 Apr 1998: a "C/#ELSEIF FILENAME(DOS)" should be
535: C           "C/#ELSEIF FILENAME(MACOS)"
536: C 20 Apr 1998: add print I/O unit to argument, and expand "$xxxx" in
537: C           PATH by environment variable.
538: C 26 Nov 2002: Extend dimensions of IDAT1 and EDAT1. (M.Sasaki)
539: C-----
540: C   INDX : I/O UNIT OF INDEX FILE
541: C   IDS : ID   FETCHED.
542: C   FILE : FILE NAME FETCHED.
543: C   PATH : CURRENT PATH.
544: C   LPATH : LENGTH OF CURRENT PATH NAME.
545: C   IOPR : message printout I/O unit.
546: C   IEND : 0 = DATA FETCHER
547: C           1 = END OF INDEX-FILE

2: C --- MVP/GMVP System ----
3: C
4: C Task controller in multitasking on distributed memory processors.
5: C
6: C Feb 1994 by M.Sasaki
7: C
8: C =====
9: C
10: C This program will be run with workhorse tasks of MVP/GMVP
11: C multitasking processes and controls sequence of calculation on
12: C multiple tasks.
13: C
14: C Initial version works on the fixed source problems only;
15: C
16: C * Started by one of the workhorse routine (may be task #0)
17: C   if necessary.
18: C * Gets request from a task that finished assigned histories
19: C   and assign next batch of histories when remaining histories exist
20: C   else sends a termination signal.
21: C
22: C ( In shared memory multi processing, such a control will be done
23: C   with exclusive reference of a shared memory area. )
24: C
25: C -----
26: C update:
27: C 6 Jun 1997: input NTHIST from parent task to enable
28: C   restart calculation on multi task mode.
29: C 06 Mar 2006: Declare NPART, NTHIST, NHASSIGN as integer*8 and
30: C   call PVMFPACK with INTEGER8 for NPART, NTHIST. (Y.Nagaya)
