(Received December 3, 2009)

Within the scope of the JAEA thermodynamic database project for performance assessment of geological disposal of high-level radioactive and TRU wastes, the refinement of the thermodynamic data for the inorganic compounds and complexes of trivalent actinoids (actinium(III), plutonium(III), americium(III) and curium(III)) and samarium(III) was carried out. Refinement of thermodynamic data for these elements was based on the thermodynamic database for americium published by the Nuclear Energy Agency in the Organisation for Economic Co-operation and Development (OECD/NEA). Based on the similarity of chemical properties among trivalent actinoids and samarium, complementary thermodynamic data for their species expected under the geological disposal conditions were selected to complete the thermodynamic data set for the performance assessment of geological disposal of radioactive wastes.

1. Introduction

Many radionuclides are contained in high-level radioactive waste (HLW) and are part of TRU waste packages, and some of them have long half-lives (more than $10^{4}$ year). It is necessary to estimate solubility of these radionuclides in ground and pore waters in natural and engineered barriers, respectively, for performance assessment of geological disposal of HLW and some TRU wastes (e.g. hulls and ends). Thermodynamic data, e.g. the solubility product of solubility limiting solids and equilibrium constants for aqueous complexes at standard state (i.e. ionic strength of 0 ), are needed to estimate the solubility and aqueous species in the ground waters and pore waters: these data are fundamental to estimating sorption and diffusion behaviors on/in engineered barriers and host rocks. The chemical properties of elements of interest have been investigated, and many thermodynamic values were obtained which are considered to be more reliable than those previously available. Therefore, the latest and the most reliable thermodynamic data with transparency and traceability will be published to carry out the reliable performance assessment by an implementer or a regulator.

Eighteen elements (actinoids, fission products, radiation products and their daughters, etc.) were selected in the second progress report on research and development of geological disposal of HLW in Japan (H12) ${ }^{1)}$ by the Japan Nuclear Cycle Development Institute (JNC), which was one of the predecessors of the Japan Atomic Energy Agency (JAEA). The JNC's thermodynamic database (JNC-TDB) was developed for the performance assessment of the geological disposal in $1999{ }^{2)}$. To develop JAEA's thermodynamic database (JAEA-TDB), thermodynamic data for more than 20 elements (not only for the performance assessment of HLW but also for that of TRU waste in geological disposal) will be selected. Selection of thermodynamic data for americium(III) in the JNC-TDB was based on the first version of TDB by the OECD/NEA ${ }^{4)}$ with a slight modification. Thermodynamic data on samarium(III), actinium(III) and curium(III) were assumed to be the same as those for americium(III) due to insufficient experimental data for these elements and because these elements have similar ionic radii and are known to form isostructural compounds and complexes that show, where reliable data are available, similarity in the values of equilibrium constants. We consider that reasonableness of the assumption should be further discussed to enhance reliability of the TDB.

The Nuclear Energy Agency in the Organisation for Economic Co-operation and Development (OECD/NEA) has developed thermodynamic databases (NEA-TDBs) for some actinides (thorium, uranium, neptunium, plutonium and americium). All the published articles
containing experimentally determined thermodynamic values were carefully reviewed and discussed among experts gathered from all over the world. Procedure for the selection of thermodynamic data is based on the guideline "TDB-1" published by the OECD/NEA ${ }^{3}$. The first and the revised version of the TDB of americium were published in $1995{ }^{4)}$ and $2003{ }^{5}$, respectively. The first and the revised version of the TDB of plutonium were published in $2001{ }^{6)}$ and $2003{ }^{5}$, respectively. Although the revised version of TDB ${ }^{5)}$ also contains some thermodynamic data for uranium(III) and neptunium(III), we will not select these data because these redox states are stable only under extremely reducing conditions and are unlikely to be stable in geological media. Selected thermodynamic data for americium(III) and plutonium(III) are listed in Table 1 and Table 2, respectively. The most enhanced thermodynamic data for trivalent actinoids are of americium(III), hence the refinement of thermodynamic data for the JAEA-TDB will be based on the thermodynamic data for americium(III) as mentioned below.

The National Cooperative for the Disposal of Radioactive Waste in Switzerland (Nagra) and the Paul Scherrer Institut (PSI) published their own TDB (Nagra/PSI-TDB) jointly in 2002 ${ }^{7)}$. Their selection of thermodynamic data on americium(III) was based on the first version of the NEA-TDB ${ }^{4}$, modified with the literature data (e.g., Neck et al. ${ }^{8)}$ that became available after the NEA-TDB review in 1995 and before they carried out their review in 2002. They also selected thermodynamic data for europium but their review did not address the selction of data for samarium and actinium. .The update version of NEA-TDB was published later (2003), hence we did not review their selected data but referred only the Nagra/PSI-TDB.

The Swedish Nuclear Fuel and Waste Management Co. (SKB) also developed their own TDB (SKB-TDB) and published in $2006{ }^{9}$. . Most of thermodynamic data were taken from the Nagra/PSI-TDB with some modifications, especially the selection of enthalpy. Selection of thermodynamic data for americium(III) and plutonium(III) was based on the Nagra/PSI-TDB, while thermodynamic data for curium(III) were assumed to be the same values as those for americium(III). It is interesting that they selected and reviewed the thermodynamic data for samarium and holmium as elements of interest in lanthanoids, but did not select actinium for review

Although the above TDBs except the JNC-TDB have not selected thermodynamic data for actinium, Ac-227, with a half-life of 21.8 y , is one of the important radionuclides as a daughter of the actinium decay series for the performance assessment of geological disposal in Japan. Therefore, we consider that thermodynamic data for actinium should be selected.

Based on the above circumstances, refinement of thermodynamic data for trivalent actinoids (actinium(III), plutonium(III), americium(III) and curium(III)) and samarium(III) (which is the only element of interest among lanthanoids in the H 12 report ${ }^{1 \text { ) }}$ ) was carried out in the present report. In selecting the data for the JAEA-TDB, a great advantage was taken of the fact that these elements show analogous behavior in their thermodynamic properties and that a very comprehensive good quality data are available for Am(III), which forms the basis for filling in the data gaps for other elements in this group.
2. Procedure for Refinement of Thermodynamic Data for JAEA-TDB

### 2.1 General Approach

Selection of thermodynamic data for the JAEA-TDB is based on the fundamental plan ${ }^{10}$, the content of which is briefly described below.

Selection of standard Gibbs free energy of formation $\left(\Delta_{\mathrm{f}} G_{\mathrm{m}}^{\mathrm{o}}\right)$, equilibrium constant of reaction at standard state $\left(K^{\circ}\right)$ and standard Gibbs free energy of reaction $\left(\Delta_{\mathrm{r}} G_{\mathrm{m}}^{\mathrm{o}}=-R T \ln K^{\mathrm{o}}\right.$, where $R$ and $T$ are gas constant and absolute temperature, respectively) is obligatory, and selection of other thermodynamic values on enthalpy, entropy and heat capacity is recommended.

Thermodynamic data for chemical compounds and species for radioelements with naturally occurring elements (e.g., halogen, oxygen, carbon, nitrogen, sulfur, phosphorus) should be selected. Thermodynamic data for elements with some organic ligands published by the OECD/NEA ${ }^{11)}$ may also be selected. Other thermodynamic data which are needed to select will be quoted from those called "Auxiliary Data" selected by the OECD/NEA ${ }^{12}$.

Review and selection of thermodynamic values obtained from experimental data should be based on the "TDB-1" guideline by the OECD/NEA ${ }^{3)}$. Thermodynamic values or databases selected by the OECD/NEA ${ }^{12)}$, the Nagra/PSI ${ }^{7)}$ and Lothenbach et al. ${ }^{13)}$, which are based on the "TDB-1" guideline ${ }^{3)}$, could be selected to the JAEA-TDB after surveying the latest literature and checking consistency of the value in the database. Otherwise review and selection of thermodynamic values should be performed after surveying the literature to collect proposed thermodynamic data.

Application of chemical analogues and models should be considered to obtain thermodynamic values for some species for which there has been no published experimental data. Some unreliable thermodynamic values, which are important for the performance assessment of geological disposal of radioactive wastes, may be selected as tentative values while specifying their reliability and the needs for the values to be determined.

All thermodynamic values should be standardized at 298.15 K and at zero ionic strength, using the Brønsted-Guggenheim-Scatchard Model (usually called the "specific ion interaction theory (SIT)") ${ }^{12)}$ for correction of ionic strength.

### 2.2 Brief Procedure of Selection of Thermodynamic Data for Trivalent Actinoids and Samarium(III)

Selection of thermodynamic data for americium(III) is based on the revised version of the NEA-TDB ${ }^{5)}$ with some slight modifications.

Thermodynamic data for curium(III) are taken from those for americium(III) without any modifications. In fact, some thermodynamic data for americium(III) are taken from (or together with) those for curium(III) in the NEA-TDB ${ }^{5)}$. This shows that the OECD/NEA recommends applying thermodynamic data for americium(III) to curium(III).

Some thermodynamic data for samarium(III) are briefly reviewed by us. We will take thermodynamic data from those for americium(III) after discussing reasonableness of applying a chemical analogue.

Thermodynamic data for actinium(III) are tentatively selected by us based on the experimentally determined values, although the determined values are insufficient.
3. Detailed Procedure of Selection of Thermodynamic Data for Trivalent Actinoids and Samarium(III)

### 3.1 Americium(III) and Curium(III)

Lists of crystal ionic radius of $\mathrm{M}^{3+}(\mathrm{M}: \mathrm{Sm}, \mathrm{Ac}, \mathrm{Pu}, \mathrm{Am}$ and Cm$)$ are shown in Table $3^{14)}$. It is shown that the variation in ionic radius of $\mathrm{Sm}^{3+}, \mathrm{Pu}^{3+}$ and $\mathrm{Cm}^{3+}$ against $\mathrm{Am}^{3+}$ is within $2 \%$. Assuming a Coulombic interaction as a mechanism of complexation of $\mathrm{M}^{3+}$ (e.g., the Hard Sphere Model ${ }^{15)}$ ), the difference in thermodynamic equilibrium constants for trivalent actinoids (except actinium due to lack of experimental data) and samarium is expected to be within the uncertainty (or error) reported in these values.. Therefore, except for actinium a chemical analogue approach should be applicable to these trivalent elements, where available reliable data for one of these elements may be subtitled for the missing data for the others..

Selection of thermodynamic data for americium(III) is based on those selected in the NEA-TDB shown in Table 1. We accepted thermodynamic data only for trivalent americium because americium would exist only in the trivalent oxidation state in the geological disposal system. Species and compounds for which the equilibrium constants $\left(\log _{10} K^{\circ}\right)$ were not selected were excluded because they were unlikely to be useful in applying thermodynamic data to geochemical calculations. Even if the $\log _{10} K^{\circ}$ values are provided in the NEA-TDB, we excluded the $\log _{10} K^{\circ}$ values for some reactions which are not expected in geologic environments (e.g., Eq. 1 involving gaseous HCl and $\mathrm{H}_{2} \mathrm{O}$ );

$$
\begin{equation*}
\mathrm{AmCl}_{3}(\mathrm{cr})+\mathrm{H}_{2} \mathrm{O}(\mathrm{~g}) \Leftrightarrow \mathrm{AmOCl}(\mathrm{cr})+2 \mathrm{HCl}(\mathrm{~g}) . \tag{1}
\end{equation*}
$$

Some $\Delta_{\mathrm{f}} G^{\circ}{ }_{\mathrm{m}}$ values were estimated by us. The $\Delta_{\mathrm{f}} G^{\circ}{ }_{\mathrm{m}}$ for $\mathrm{NO}_{2}{ }^{-}$of $-32.200 \pm 0.100 \mathrm{~kJ} \cdot \mathrm{~mol}^{-1}$ was derived from the NBS Table ${ }^{16)}$ with approximate errors added by us. Selected thermodynamic data on americium(III) for the JAEA-TDB are summarized in Table 4.

As mentioned above, some thermodynamic data for americium(III) are taken from (or together with) those for curium(III) in the NEA-TDB ${ }^{5}$. This shows that the OECD/NEA recommends applying thermodynamic data for americium(III) to curium(III), although there are no solubility data for curium(III). Therefore, equilibrium constants for curium(III) are taken from those for americium(III) without any modifications in the JAEA-TDB.

On the other hand, Gibbs free energy of formation $\left(\Delta_{\mathrm{f}} \mathrm{G}^{\circ}{ }_{\mathrm{m}}\right)$ for $\mathrm{Cm}^{3+}$ should be taken from elsewhere because it has not been selected by the OECD/NEA. We have found that

Fuger and Oetting ${ }^{17)}$ have thoroughly reviewed and selected thermodynamic data for actinoid (from actinium through lawrencium) elements and compounds. Some of molar enthalpies and entropies of formation for curium(III) selected by Fuger and Oetting ${ }^{17}$ ) were accepted by the OECD/NEA. Although the $\Delta_{f} G^{\circ}{ }_{\mathrm{m}}$ values for actinoid(III) aqua ions were reevaluated in the NEA-TDB, selected values by the OECD/NEA were quite similar to those by Fuger and Oetting as shown in Table 5. Therefore, for consistency the $\Delta_{\mathrm{f}} G^{\circ}{ }_{\mathrm{m}}$ value of $\mathrm{Cm}^{3+}((-595.802 \pm 6.276)$ $\mathrm{kJ} \cdot \mathrm{mol}^{-1}$ ) was taken from Fuger and Oetting ${ }^{17}$. Gibbs free energies of formation for other curium(III) aqueous complexes and solid phases were determined from $\log K^{\circ}$ values of reactons involving these species, and Gibbs free energies of formation of $\mathrm{Cm}^{3+}$ and other other non-curium species involved in the reactions.

Selected thermodynamic data for curium(III) for the JAEA-TDB are summarized in Table 6. Thermodynamic data of enthalpy, entropy and heat capacity were not selected in the JAEA-TDB due to insufficiency of data and models used.

### 3.2 Plutonium(III)

Thermodynamic data on plutonium(III) were selected by the OECD/NEA ${ }^{5)}$ as shown in Table 2. However, it is found that the selected thermodynamic data for plutonium(III) is much more limited than that for americium (compare Table 2 and Table 1). The reason for the difference is a basic policy to select thermodynamic data by the OECD/NEA, which focuses on experimental data, careful review of literature, and exclusion of unreliable data and/or conclusions. Hence selected thermodynamic data are considered to be very reliable. However, only using the selected data for plutonium(III) from the NEA-TDB may sometimes because of incompleteness of the data lead to wrong conclusions from the point of view of performance assessment.

Comparing selected equilibrium constants for plutonium(III) species and compounds to those for americium(III), it is found that the values of equilibrium constants are similar. Furthermore, the ionic radius of $\mathrm{Pu}^{3+}$ is quite similar to that of $\mathrm{Am}^{3+}$ as shown in Table 3, therefore interaction between a central ion (i.e. $\mathrm{Am}^{3+}$ or $\mathrm{Pu}^{3+}$ ) and ligands is expected to be quite similar, as the comparisons of the values of equilibrium constants show. Thus equilibrium constants for americium(III) species and compounds, where the data for corresponding reactions for $\mathrm{Pu}(\mathrm{III})$ are lacking, are considered to be applicable to use for plutonium(III) reactions.

Plutonium(III) easily oxidizes to the tetravalent state. Even in the reducing conditions, oxidation state of plutonium tends to become tetravalent in basic solutions, and no
thermodynamic data for plutonium(III) carbonates and carbonate complexes ${ }^{\text {a) }}$ are recommended by the OECD/NEA. We basically agree with the recommendation, but we select thermodynamic data for carbonate complexes and solids of plutonium(III) from the comprehensive point of view.

Gibbs free energy of formation for $\mathrm{Pu}^{3+}\left((-578.984 \pm 2.688) \mathrm{kJ}^{2} \mathrm{~mol}^{-1}\right)$ is taken from the NEA-TDB ${ }^{5)}$. Gibbs free energies of formation of other plutonium(III) species were estimated from Gibbs free energies of formation of $\mathrm{Pu}^{3+}$ and other species involved in the reaction including the given species, and from $\log K^{\circ}$ values of the reaction.

Selected thermodynamic data on plutonium(III) for the JAEA-TDB are summarized in Table 7. Thermodynamic data of enthalpy, entropy and heat capacity were not selected in the JAEA-TDB due to insufficiency of data and models used.

### 3.3 Samarium(III)

The OECD/NEA has no current plans to review data for samarium(III). Some experimentally determined thermodynamic data for $\mathrm{Sm}(\mathrm{III})$ are available but the total amount of data available data for Sm (III) is far less than that for americium(III). Equilibrium constants for samarium(III) hydroxides and hydrolyses species which have been experimentally determined are shown in Table 8 as an example. Although there were some studies to determine the solubility product of $\operatorname{Sm}(\mathrm{OH})_{3}(\mathrm{~s})$ as shown in Table 8, most of the experiments were performed in a short time periods (such as half an hour) ${ }^{18)}$. The short contacting time may be the reason that most of the obtained equilibrium constants for $\operatorname{Sm}(\mathrm{OH})_{3}(\mathrm{~s})$ are much lower than those for $\mathrm{Am}(\mathrm{OH})_{3}(\mathrm{am})$.

We believe that the most reliable thermodynamic data for samarium(III) hydroxide and hydrolyses species is by Shibutani ${ }^{19}$. She conducted solubility experiments not only for $\mathrm{Sm}(\mathrm{OH})_{3}(\mathrm{~s})$ but also for $\mathrm{SmCO}_{3} \mathrm{OH}(\mathrm{s})$ and approached the solubility from both over- and under-saturation directions. Contact time was up to 106 days. She determined solubility products and hydrolyses constants for samarium(III) as shown in Table 8, and the hydrolysis constant of $\operatorname{Sm}(\mathrm{OH})_{2}{ }^{+}$was revised afterwards due to large uncertainty ${ }^{20}$. The obtained equilibrium constants were quite similar to those for americium(III) as shown in Table 4. As with plutonium(III), the ionic radius of $\mathrm{Sm}^{3+}$ is quite similar to that of $\mathrm{Am}^{3+}$ as shown in Table 3, hence interaction between a central ion (i.e. $\mathrm{Am}^{3+}$ or $\mathrm{Pu}^{3+}$ ) and ligands is considered to be quite similar. Thus, equilibrium constants for americium(III) species and compounds were considered to be applicable to use for samarium(III).

Gibbs free energy of formation for $\mathrm{Sm}^{3+}\left(-666.6 \mathrm{~kJ} \cdot \mathrm{~mol}^{-1}\right)$ was taken from the NBS Tables ${ }^{16)}$ with addition of an uncertainty of the value $\left(1 \mathrm{~kJ} \cdot \mathrm{~mol}^{-1}\right)$ because neither the OECD/NEA nor the literature by Fuger and Oetting ${ }^{177}$ has selected this value.

Gibbs free energies of formation for other samarium(III) species were estimated from Gibbs free energies of formation of $\mathrm{Sm}^{3+}$ and other species involved in the reaction including the given species, and from $\log K^{\circ}$ values of the reaction.

Gibbs free energies of reaction which were easily determined from $\log K^{\circ}$ values.
Selected thermodynamic data on samarium(III) for the JAEA-TDB are summarized in Table 9. Thermodynamic data of enthalpy, entropy and heat capacity were not selected in the JAEA-TDB due to insufficiency of data and models used.

### 3.4 Actinium(III)

The OECD/NEA has no current plans to review data for actinium(III) We found only one article about the solubility of actinium(III). Ziv and Shestakova conducted solubility experiments on actinium(III) hydroxide from the oversaturation direction in $0.001 \mathrm{M} \mathrm{NH}_{4} \mathrm{NO}_{3}$ solution, and obtained a solubility product of fresh and old $\mathrm{Ac}(\mathrm{OH})_{3}(\mathrm{~s})$ (with contacting time of one hour and one week, respectively) as shown in Table $8{ }^{21)}$. They found that the obtained solubility product for $\operatorname{Ac}(\mathrm{OH})_{3}(\mathrm{~s})$ is more than 4 orders of magnitude larger than that for $\mathrm{Am}(\mathrm{OH})_{3}(\mathrm{am})$. One of the reasons may be radiation effect of $\alpha$-emitters (i.e. actinium itself), but a major reason is considered to be the difference in the crystal ionic radius between $\mathrm{Ac}^{3+}$ (shown in Table 3) and other trivalent lanthanoid and actinoid ions. Large ionic radius may weaken Coulomb interactions between a central ion and ligands and thus destabilize solid phases. We are uncertain whether the differences in observed solubility products are a result of the experimental difficulties or truly due to the inherent differences in the chemistry of these elements. However, the study by Ziv and Shestakova ${ }^{21)}$ was the only one for solubility of actinium(III); therefore we refer the solubility data by Ziv and Shestakova ${ }^{21)}$ to estimate solubility product of $\mathrm{Ac}(\mathrm{OH})_{3}(\mathrm{am})$.

On the other hand, formation constants for actinium(III) complexes may be similar to those of other trivalent lanthanoid and actinoid ions. Stability constants for actinium(III) with chloride and bromide ions were determined by Fukasawa et al. ${ }^{22)}$ together with some trivalent lanthanoids and actinoids by solvent extraction method as shown in Table $10{ }^{22)}$. It was found that differences in the values of stability constants between actinium(III) and other trivalent lanthanoids/actinoids were quite small (within 0.2). This result suggests that the effect of
crystal ionic radius is negligible in the aqueous species.
Based on above experimental observations, we decided refinement of thermodynamic data for actinium(III) as follows:

- Refinement of thermodynamic data for actinium(III) was based on those for americium(III),
- Solubility products for amorphous actinium(III) compounds $\left(\mathrm{Ac}(\mathrm{OH})_{3}(\mathrm{am})\right.$, $\mathrm{AcPO}_{4}(\mathrm{am}, \mathrm{hydr}), \mathrm{Ac}_{2}\left(\mathrm{CO}_{3}\right)_{3}(\mathrm{am})$ and $\left.\mathrm{AcCO}_{3} \mathrm{OH}(\mathrm{am})\right)$ were set to the values as those for americium(III), with addition of larger uncertainties (4 order of magnitude),
- Solubility products for crystalline actinium(III) compounds were not selected due to destabilization by self $\alpha$-radiation effect of actinium,
- Stability constants for actinium(III) complexes were taken from those of americium(III) with addition of larger uncertainties ( 0.2 order of magnitude).

Gibbs free energy of formation for $\mathrm{Ac}^{3+}\left(-640.152 \pm 25.104 \mathrm{~kJ} \cdot \mathrm{~mol}^{-1}\right)$ was taken from Fuger and Oetting ${ }^{17}$ on the same basis as that of $\mathrm{Cm}^{3+}$. Gibbs free energies of formation of complex actinium(III) species were estimated from the Gibbs free energies of formation of $\mathrm{Ac}^{3+}$ and of other species involved in the given reaction and from $\log K^{\circ}$ values of the reaction.

Selected thermodynamic data for actinium(III) for JAEA-TDB are summarized in Table 11. Thermodynamic data of enthalpy, entropy and heat capacity were not selected in the JAEA-TDB due to insufficiency of data and models used. All the obtained thermodynamic data for actinium(III) should be treated as tentative values, because the correction of values and addition of uncertainties are not quantitative.

## 4. Conclusions

Thermodynamic data for samarium(III), actinium(III), plutonium(III), americium(III) and curium(III) were refined on the basis of those of americium(III) from the OECD/NEA. It was found that equilibrium constants for samarium(III), plutonium(III) and curium(III) were almost the same as those for americium(III). Solubility products and stability constants for actinium(III) were set to the same mean values as those for americium(III) with addition of much larger uncertainties based on experimental observations noted in the literature. Selected thermodynamic data will be included in the JAEA-TDB, and revision of thermodynamic data will enhance reliability of thermodynamic database comparing with previous ones.

| 量濃度 ${ }^{(a)}$ ，濃度 | モル毎立方メートル | $\mathrm{mol} / \mathrm{m}^{3}$ |
| 質 量 濃 度 | キログラム毎立法メートル | $\mathrm{kg} / \mathrm{m}^{3}$ |
| 輝 度 | カンデラ毎平方メートル | $\mathrm{cd} / \mathrm{m}^{2}$ |
| 屈 折 率 ${ }^{(b)}$ | （数字の）1 | 1 |
| 比透磁率（b） | （数字の） 1 | 1 |

（a）量漫度（amount concentration）は臨床化学の分野では物質瀑度 （substance concentration）ともよばれる。
（substance concentration）ともよばれる。
これらは無次元量あるいは次元 1 をもった量であるが，そのこと
を表す単位記号である数子の 1 は通常は記しない。

（a）SI接頭語は固有の名称と記号を持つ組立単位と組み合わせても使用できる。しかし接頭語を付した単位はもはや コヒーレントではない。
（b）ラジアンとステラジアンは数字の 1 に対する単位の特別な名称で，量についての情報をつたえるために使われる。実際には，使用する時には記号 rad ひひ sr が用いられるが，習慣として組立単位としての記号である数字の 1 は明示されない。
（c）測光学ではステラジアンといら名称と記号srを単位の表し方の中に，そのまま維持している。
（d）ヘルツは周期現象についてのみ，ベクレルは放射性核種の統計的過程についてのみ使用される
（e）セルシウス度はケルビンの特別な名称で，セルシウス温度を表すために使用される。セルシウス度とケルビンの
単位の大きさは同一である。したがって，温度差や温度間隔を表す数値はどちらの単位で表しても同じである。 （f）放射性核種の放射能（activity referred to a radionuclide）は，しばしば誤った用語で＂radioactivity＂と記される。 （g）単位シーベルト（PV，2002，70，205）についてはCIPM勧告2（CI－2002）を参照。

表 4．単位の中に固有の名称と記号を含むSI組立単位の例

| 組立量 | SI 組立単位 |  |  |
| :---: | :---: | :---: | :---: |
|  | 名称 | 記号 | SI 基本単位による表し方 |
| 粘 度 | パスカル秒 | Pa s | $\mathrm{m}^{-1} \mathrm{~kg} \mathrm{~s}^{-1}$ |
| 力のモーメン | ニュートンメートル | Nm | $\mathrm{m}^{2} \mathrm{~kg} \mathrm{~s}^{-2}$ |
| 表 面 張 力 | ニュートン毎メートル | $\mathrm{N} / \mathrm{m}$ | $\mathrm{kg} \mathrm{s}^{-2}$ |
| 角 速 度 | ラジアン毎秒 | $\mathrm{rad} / \mathrm{s}$ | $\mathrm{m} \mathrm{m}^{-1} \mathrm{~s}^{-1}=\mathrm{s}^{-1}$ |
| 角 加 速 度 | ラジアン毎秒毎秒 | $\mathrm{rad} / \mathrm{s}^{2}$ | $\mathrm{m} \mathrm{m}^{-1} \mathrm{~s}^{-2}=\mathrm{s}^{-2}$ |
| 熱流密度，放射照度 | ワット毎平方メートル | $\mathrm{W} / \mathrm{m}^{2}$ | $\mathrm{kg} \mathrm{s}^{-3}$ |
| 熱容量，エントロピー | ジュール毎ケルビン | J／K | $\mathrm{m}^{2} \mathrm{~kg} \mathrm{~s}^{-2} \mathrm{~K}^{-1}$ |
| 比熱容量，比エントロピー | ジュール毎キログラム毎ケルビン | J／（kg K） | $\mathrm{m}^{2} \mathrm{~s}^{-2} \mathrm{~K}^{-1}$ |
| 比エ ネ ル | ジュール毎キログラム | $\mathrm{J} / \mathrm{kg}$ | $\mathrm{m}^{2} \mathrm{~s}^{-2}$ |
| 熱 伝 導 率 | ワット毎メートル毎ケルビン | W／（m K） | $\mathrm{mkg} \mathrm{s}^{-3} \mathrm{~K}^{-1}$ |
| 体 積エネネ | ジュール毎立方メートル | $\mathrm{J} / \mathrm{m}^{3}$ | $\mathrm{m}^{-1} \mathrm{~kg} \mathrm{~s}^{-2}$ |
| 電 界の強さ | ボルト毎メートル | V／m | $\mathrm{mkg} \mathrm{s}^{-3} \mathrm{~A}^{-1}$ |
| 電 荷 密 度 | クーロン毎立方メートル | $\mathrm{C} / \mathrm{m}^{3}$ | $\mathrm{m}^{-3} \mathrm{sA}$ |
| 表 面 電 荷 | クーロン毎平方メートル | $\mathrm{C} / \mathrm{m}^{2}$ | $\mathrm{m}^{-2} \mathrm{sA}$ |
| 電束密度，電気変位 | クーロン毎平方メートル | $\mathrm{C} / \mathrm{m}^{2}$ | $\mathrm{m}^{-2} \mathrm{sA}$ |
| 誘 電 率 | ファラド毎メートル | F／m | $\mathrm{m}^{-3} \mathrm{~kg}^{-1} \mathrm{~s}^{4} \mathrm{~A}^{2}$ |
| 透 磁 率 | ヘンリー毎メートル | H／m | $\mathrm{mkg} \mathrm{s}{ }^{-2} \mathrm{~A}^{-2}$ |
| モルエ ネ ルギー | ジュール毎モル | $\mathrm{J} / \mathrm{mol}$ | $\mathrm{m}^{2} \mathrm{~kg} \mathrm{~s}^{-2} \mathrm{~mol}^{-1}$ |
| モルエントロピー，モル熱容量 | ジュール毎モル毎ケルビン | $\mathrm{J} /(\mathrm{mol} \mathrm{K})$ | $\mathrm{m}^{2} \mathrm{~kg} \mathrm{~s}^{-2} \mathrm{~K}^{-1} \mathrm{~mol}^{-1}$ |
| 照射線量（X線及び $\gamma$ 線） | クーロン毎キログラム | C／kg | $\mathrm{kg}^{-1} \mathrm{sA}$ |
| 吸収 線 量 率 | グレイ毎秒 | Gy／s | $\mathrm{m}^{2} \mathrm{~s}^{-3}$ |
| 放 射 強 度 | ワット毎ステラジアン | W／sr | $\mathrm{m}^{4} \mathrm{~m}^{-2} \mathrm{~kg} \mathrm{~s}^{-3}=\mathrm{m}^{2} \mathrm{~kg} \mathrm{~s}^{-3}$ |
| 放 射 輝 度 | ワット毎平方メートル毎ステラジアン | $\mathrm{W} /\left(\mathrm{m}^{2} \mathrm{sr}\right)$ | $\mathrm{m}^{2} \mathrm{~m}^{-2} \mathrm{~kg} \mathrm{~s}^{-3}=\mathrm{kg} \mathrm{s}^{-3}$ |
| 酵 素 活 性 濃 度 | カタール毎立方メートル | kat／m ${ }^{3}$ | $\mathrm{m}^{-3} \mathrm{~s}^{-1} \mathrm{~mol}$ |

| 乗数 | 接頭語 | 記号 | 乗数 | 接頭語 | 記号 |
