Level Schemes for some Fission Product Nuclides
-Comparison of Level Schemes used by JAERI and Petten-

Zyun-itiro MATUMOTO, Tooru MURATA^{*} and Ryuzo NAKASIMA^{**}

Fission Product Nuclear Data Working Group,
Japanese Nuclear Data Committee, Tokai Research Establishment,
JAERI

(received June 5, 1978)

Level schemes of 24 fission product nuclides comparable between JAERI's and Petten's are presented. When the assignments of spin and parity are different between, the reasons for JAERI's are described. In typical cases are compared the cross section of inelastic scattering and (n,γ) reaction calculated using the JAERI's and Petten's level schemes. The distribution of the low-lying levels of which spins and parities are assigned, is also presented.

1. Introduction

In order to evaluate the neutron cross sections, it is necessary to use the evaluated level schemes of relevant nuclides. However, the critical evaluation of level schemes, of course, is so difficult that the international collaboration is highly required. In making critical evaluation, the determination of level energies and the assignments of spin and parity should be worked out carefully based on many kinds of experimental data, not only decay data but also reaction data. In this case, the determined level energies, spins and parities can be ensured only when the all available experimental data are not inconsistent with each other. Critical evaluation, however, yields a little well-established assignments in many cases, while for cross section evaluation, the spin-parity assignments to levels are required as many as possible.

Working group on evaluation of fission product nuclear data has selected about 100 nuclides as important ones. However, the level schemes of the most of them appeared in Nuclear Data Sheets were not satisfactory to our purpose since some are out-of-date or some include only a little information. Therefore, we were obliged to make our own level schemes based on the all available experimental information, and using not only strong arguments but also weak arguments. In some cases, the spins and/or the parities have been unwillingly selected without any reasonable arguments only when the assignments were necessary in calculating the cross sections. One typical example for such assignments is the spin-parity selection based on only gamma

transitions from or to other known levels. The energies of levels (in MeV) have been taken from Nuclear Data Sheets or original paper.

In this report, our level Schemes, reported previously¹⁾ and revised recently, are compared with those reported by Gruppelaar²⁾ for 24 nuclides. In section 2, the level energies and spin-parities of the low-lying levels are tabulated for three cases. In section 3, the step-wise diagrams for the distribution of low-lying levels of which spins and parities are assigned are presented. Although the diagram may be only a reference for the level density, it seems to be still useful in statistical calculation of cross section for high energy region. In section 4, the calculated inelastic scattering cross sections are compared by using the different level schemes.

2. Comparison of Level Schemes used by JAERI and Petten

Level schemes, reported previously¹⁾ and revised recently by us and those reported by Gruppelaar²⁾ are tabulated in subsection 2.1 2.24. Comments are added if both of our revised ones and Gruppelaar's disagree with each other. However, the most of the comments are based on rather quite weak arguments unless new experimental evidence offers the convincing arguments.

transitions from or to other known levels. The energies of levels (in MeV) have been taken from Nuclear Data Sheets or original paper.

In this report, our level Schemes, reported previously¹⁾ and revised recently, are compared with those reported by Gruppelaar²⁾ for 24 nuclides. In section 2, the level energies and spin-parities of the low-lying levels are tabulated for three cases. In section 3, the step-wise diagrams for the distribution of low-lying levels of which spins and parities are assigned are presented. Although the diagram may be only a reference for the level density, it seems to be still useful in statistical calculation of cross section for high energy region. In section 4, the calculated inelastic scattering cross sections are compared by using the different level schemes.

2. Comparison of Level Schemes used by JAERI and Petten

Level schemes, reported previously¹⁾ and revised recently by us and those reported by Gruppelaar²⁾ are tabulated in subsection 2.1 2.24. 		2.4211	4^+	2.4210	4^+
		2.4419	4^+	2.4420	3^+

1.9970 level Uncertain β from ^{102}Rh (5^+ or 6^+) with $\log ft = 10.2$.

Only uncertain γ to 2^+ level. No other evidence. If this level is adopted, 3^- is more probable rather than 5^+ .

2.1550 level Proposed by $^{100}\text{Mo}(\alpha, 2n\gamma)$ as an uncertain level. Not populated in ^{102}Tc (1^+) and ^{102m}Rh (1^- or 2^-) decays, thus assignment of 1^+ is not consistent even if this level exists.

2.26125 level Log $ft = 6.5$ from ^{102m}Rh (1^- or 2^-) suggests 0^+ , 1^+ , 2^+ , 3^- . γ 's to 0^+ , 2^+ , 3^+ , and possibly 4^+ levels select 2^+ .

2.4419 level 4.35 m ^{102}Tc decays to 4^+ levels but not to 0^+ , 2^+ , 3^+ levels in ^{102}Ru , thus suggesting $J \geq 5$ for ^{102m}Tc . Log $ft = 6.32$ suggests 4^- , ≥ 5 to 2.4419 level. γ to 2^+ level selects 4^+ .

$2.10^{104} \text{Ru}_{44}$

		1.8747
		1.8790
		1.9710
		1.9930

1.3558 level ^{104}Tc decay experiment⁸⁾ proposed this level by placing 462 keV γ between this and 0.8930 levels, but ref. 9) did not observe 462 keV γ in ^{104}Tc decay.

1.5020 level 18.2 m ^{104}Tc decay to 0.35799 (2^+) level in ^{104}Ru with log ft = 7.4 and to 0.8885 (4^+) level with log ft = 7.7, thus suggesting 2^- , 3^+ and 4^- for 18.2 m ^{104}Tc . Log ft = 8.1 to 1.5020 level suggests 0^+ , 1^+ , 2^+ , 3^+ , 4^+ , 5^+ , 6^+ . γ 's to 2^+ and 4^+ but no γ to 0^+ selects 3^+ or 4^+ . Not possible to select unique J^π from these possibilities.

1.5160 level Log ft \geq 8. γ 's to 2^+ , 3^+ , but no γ to 0^+ , 4^+ . Possible assignment is 2^- .

1.7560 level No experimental evidence could be found.

1.8747 level Log ft > 8.0. γ 's to 2^+ , 4^+ but no γ to 0^+ . Possible assignment is 3^+ or 4^+ .

1.8790 level No experimental evidence could be found.

1.9710 level Log ft = 7.2 suggests 1^+ , 2^+ , 3^+ , 4^+ , 5^+ . γ 's to 0^+ , 2^+ selects 1^+ or 2^+ .

1.9930 level ^{104}Tc decay experiment⁸⁾ proposed this level with 2^+ , but no evidence supporting this assignment is seen in ref. 9).

$^{107}_{46}\text{Pd}$

0.3482 level No β from ^{107}Rh ($5/2^+$, $7/2^+$) suggests $J=1/2$ or $J>9/2$. γ 's from $5/2^+$ and to $1/2^+$, $5/2^+$ prefers $1/2^+$.

0.3924 level Log ft = 5.8 in ^{107}Rh ($5/2^+$, $7/2^+$) decay suggests $3/2^+$ to $9/2^+$. γ 's to $5/2^+$, $7/2^+$ but no γ to $1/2^+$ prefers $7/2^+$ or $9/2^+$. No reason exists to choose $7/2^+$.

0.6200 level No experimental evidence could be found.

0.685 level $\ell=3$ in (d,p) suggests $7/2^-$.

0.806 and 0.809 levels Doublet of $\ell=1$ and 2 is suggested in (d,p), thus $1/2^-$, $3/2^-$ and $3/2^+$, $5/2^+$ are probable to both levels. $5/2^+$ is suggested in (d,p) to 0.809 level. $3/2^-$ is suggested in (d,p) to one of 0.806-0.809 doublet.

0.9300 level No experimental evidence could be found.

0.9500 level No experimental evidence could be found.

0.9800 level No experimental evidence could be found.

1.0400 level No experimental evidence could be found.

1.0600 level No experimental evidence could be found.

1.0710 level (d,p) and (d,t) suggest $3/2^+$ or $5/2^+$.

1.1020 level Log ft = 5.8 from ^{107}Rh ($5/2^+$, $7/2^+$) decay suggests $3/2^+$ to $9/2^+$. No γ to $1/2^+$ suggests $7/2^+$ or $9/2^+$.

1.1130 level (d,p) suggests $3/2^+$, but $5/2^+$ is still possible.

1.1200 level $\ell=0$ in (d,t) shows $1/2^+$.

1.1490 level Probable β from ^{107}Rh ($5/2^+$, $7/2^+$) with log ft = 6.0 suggests $3/2^+$ to $9/2^+$. No γ to $1/2^+$ suggests $7/2^+$ or $9/2^+$.

1.1600 level $3/2^+$ is suggested in (d,p).

1.1670 level $\ell=0$ in (d,t) shows $1/2^+$.

1.2140 level $\ell=2$ in (d,p) and (d,t) suggests $3/2^+$ or $5/2^+$.

2.16 $^{108}_{46}\text{Pd}$

Adopted		Revised		RCN	
0.0	0^+	0.0	0^+	0.0	0^+

		2.2825	5^+		
		2.318	5^-		
		2.362	2^+		
		2.392	2^+		

1.5400 level ($n, n'\gamma$) suggests $1^+, 2^+$. No γ to 4^+ selects 1^+ .

1.6100 level Observed in (p, p') and (d, d') . No evidence for spin assignment.

1.7000 level No experimental evidence could be found.

1.771 level ($n, n'\gamma$) and $(t, p)^{14})$ show 6^+ .

2.046 level ($n, n'\gamma$) and (t, p) show 3^- .

2.141 level (t, p) shows 0^+ .

2.214 level (t, p) shows 2^+ .

2.2825 level No β from low-spin ^{108}Rh , but populated indirectly from high-spin ^{108}Rh decay suggest $J>3$. No γ to $0^+, 2^+$ but $3^+, 4^+$ implies 5^+ .

2.318 level (t, p) shows 5^- .

2.362 level (t, p) shows 2^+ .

2.392 level (t, p) shows 2^+ .

1.714 level No β from ^{139}Ba ($7/2^-$) suggests $1/2^+$, $3/2^-$, or $11/2^-$, $>11/2$. γ to $7/2^+$ in ($n, n'\gamma$) and (α, α') suggests $\pi=+$. Spin assignment is impossible based on these evidences.

1.756 level No β from ^{139}Ba ($7/2^-$) suggests $1/2^+$, $3/2^-$ or $11/2^-$, $>11/2$. γ to $7/2^+$ in ($n, n'\gamma$) and the ($n, n'\gamma$) data

$^{139}_{57}\text{La}$

suggests $\pi=+$. Spin assignment is impossible based on these evidences.

1.762 level Log ft=8.8 from ^{139}Ba ($7/2^-$) suggests $3/2^+$, $5/2^+$, $7/2^+$, $9/2^+$, $11/2^+$. Nuclear Data Sheets indentified this level with $9/2$ level found in (γ, γ') .

1.767 level Log ft=9.5 from ^{139}Ba ($7/2^-$) suggests $3/2^+$, $11/2^+$ or $5/2^+$, $7/2^+$, $9/2^+$. γ 's to $7/2^+$ and $5/2^+$ prefers $3/2^+$.

1.775 level No β from ^{139}Ba ($7/2^-$) suggests $1/2^+$, $3/2^-$ or $11/2^-$, $>11/2$. $\pi=+$ in (α, α') .

1.820 level No β from ^{139}Ba ($7/2^-$) suggests $1/2^+$, $3/2^-$ or $11/2^-$, $>11/2$. γ to $7/2^+$ in $(n, n'\gamma)$. $\lambda=0, 2$ in $(^3\text{He}, d)$ suggests $\pi=+$. Spin assignment is impossible based on these evidences.

1.838 level No β from ^{139}Ba ($7/2^-$) suggests $1/2^+$, $3/2^-$ or $11/2^-$, $>11/2$. γ to $7/2^+$ in $(n, n'\gamma)$.

1.857 level Log ft=9.5 from ^{139}Ba ($7/2^-$) suggests $3/2^+$, $11/2^+$ or $5/2^+$, $7/2^+$, $9/2^+$. $\lambda=2$ in $(^3\text{He}, d)$ suggests $3/2^+$, $5/2^+$.

1.894 level No β from ^{139}Ba ($7/2^-$) suggests $1/2^+$, $3/2^-$, $11/2^-$, $>11/2$. γ from $9/2^-$ in (γ, γ') .

1.922 level Log ft=9.4 from ^{139}Ba ($7/2^-$) suggests $3/2^+$, $11/2^+$ or $5/2^+$, $7/2^+$, $9/2^+$. γ 's to $5/2^+$ and $7/2^+$.

1.943 level No β from ^{139}Ba ($7/2^-$) suggests $1/2^+$, $3/2^-$, $11/2^-$, $>11/2$. $\pi=+$ in (α, α') .

				1.783	$5/2^+$
				1.809	$3/2^-$
				1.823	$5/2^+$
				1.846	$5/2^+$

1.4561 level Log ft=8.7 from ^{141}Nd ($3/2^+$) suggests $1/2^-$, $3/2^-$, $5/2^-$, or possibly $7/2^-$. $\gamma\gamma'(\theta)$ suggests $5/2$ or $9/2$, thus $5/2^-$ is selected. However, (d, d') suggests $\pi=+$ probably.

1.493 level No ε -decay from ^{141}Nd ($3/2^+$) suggests $7/2^+$, $>7/2$. γ to $7/2^+$ but not to $5/2^+$.

1.513 level No ε -decay from ^{141}Nd ($3/2^+$) suggests $7/2^+$, $>7/2$. Probable γ 's from $7/2$ and $5/2^+$ in (γ, γ') .

$^{141}_{59}\text{Pr}$

- 1.520 level No ϵ -decay from ^{141}Nd ($3/2^+$) suggests $7/2^+$, $>7/2$. γ 's to $5/2^+$ and $7/2^+$. (d, d') suggests $\pi=+$.
- 1.570 level No ϵ -decay from ^{141}Nd ($3/2^+$) suggests $7/2^+$, $>7/2$. Only a γ to $11/2^-$ level in $(\alpha, 2n\gamma)$.
- 1.578 level If this is identified with 1.5802 level populated in ^{141}Nd decay, $\log ft=7.0$ suggests $1/2^+$, $3/2^+$, $5/2^+$. γ 's to $5/2^+$ and $7/2^+$ selects $3/2^+$ and $5/2^+$.
- 1.604 level No ϵ -decay from ^{141}Nd ($3/2^+$) suggests $7/2^+$, $>7/2$. $\lambda=2$ in $(^3\text{He}, d)$.
- 1.608 level Log $ft=6.9$ from ^{141}Nd ($3/2^+$) suggests $1/2^+$, $3/2^+$, $5/2^+$. No γ to $7/2^+$ but $5/2^+$ prefers $1/2^+$.
- 1.651 level No ϵ -decay from ^{141}Nd ($3/2^+$) suggests $7/2^+$, $>7/2$. Only a γ to $5/2^+$ in $(n, n'\gamma)$.
- 1.655 level Probable γ 's from $5/2^-$ and $5/2^+$.
- 1.657 level Log $ft=7.9$ from ^{141}Nd ($3/2^+$) suggests $1/2^+$, $3/2^+$, $5/2^+$. No γ to $7/2^+$ but $5/2^+$ selects $1/2^+$, $3/2^-$.
- 1.764 level Observed in (d, d') .
- 1.767 level Only a γ to $11/2^-$ in $(\alpha, 2n\gamma)$.
- 1.783 level γ 's to $5/2^+$ and $7/2^+$ in $(n, n'\gamma)$.
- 1.809 level γ 's to $5/2^+$ and $7/2^+$ in $(n, n'\gamma)$.
- 1.823 level Reported in (n, n') experiment.
- 1.846 level γ from $5/2^+$ in (γ, γ') .

3. Step-wise Diagrams for Distribution of Low-lying levels

The step-wise diagrams for the different distribution of low-lying levels are illustrated in Figs. 3.1~3.24, where the solid lines are those revised by us and dashed lines by Gruppelaar. The straight lines are obtained by fitting the level distribution with

$$N(E) = k e^{E/T},$$

where E is excitation energy of nucleus (in MeV), T is the nuclear temperature (in MeV) and N(E) is number of the excited levels up to the excitation energy E. The values of k and T are tabulated in Table 1 for odd-A and even-even nuclides. It seems to be seen the even-odd effect in T or k, T is larger or k is smaller for even-even nuclide compared to odd-A, if quite rough consideration is applicable.

The exceptions are seen in the cases of ^{139}La and ^{141}Pr . There exist, however, the large energy gaps near the ground state as shown in Figs. 3.23 and 3.24, because these nuclei have neutron magic number (N=82). We gave, therefore, the additional values of k and T, which were obtained by fitting the level distribution above the second excited states with $N(E)-2 = k \cdot e^{(E-E_0)/T}$. The results give good trends for the above mentioned systematics.

Fig. 3.1~3.24 Step-wide diagrams for distribution of low-lying levels for 24 nuclides by the present authors (solid lines) and by Gruppelaar²⁾ (dashed lines). The straight lines are fitted by $N(E)=k \exp(E/T)$. The notations are the followings; N(E) : Number of levels up to excitation energy E

E : excitation energy of nucleus (in MeV)
T : nuclear temperature (in MeV)
k : proportional constant.

4. Examples of Calculated Inelastic Scattering and Capture Cross Sections

Calculated inelastic scattering cross sections for typical cases, ^{101}Ru , ^{103}Rh and ^{139}La , are compared using different level schemes, previously adopted and revised recently by JAERI, and reported by Petten. The computer code CASTHY has been used with optical potential parameters obtained by fitting the total cross sections.

Partial cross sections of inelastic scattering from each level are tabulated in Table 2~4. Total inelastic scattering cross sections are illustrated as a function of the neutron energy in Figs. 4.1(a)~4.3(a). The cross sections for (n,γ) reactions are also illustrated in Figs. 4.1(b)~4.3(b).

5. Remarks

This report was a part of works on evaluation of fission product nuclear data for about 100 important nuclides. The purpose of this work was to clarify the present status of the level information and how the ambiguity of the experimental data affects the evaluation of inelastic scattering and capture cross sections. However, the level scheme proposed here are still not so satisfactory because of the very complex and poor information of the experimental data. In many cases, we were

E : excitation energy of nucleus (in MeV)
T : nuclear temperature (in MeV)
k : proportional constant.

5. Remarks

This report was a part of works on evaluation of fission product nuclear data for about 100 important nuclides. The purpose of this work was to clarify the present status of the level information and how the ambiguity of the experimental data affects the evaluation of inelastic scattering and capture cross sections. However, the level scheme proposed here are still not so satisfactory because of the very complex and poor information of the experimental data. In many cases, we were

obliged to construct our level schemes using not only strong argument but also weak argument. In some cases, the spin-parities have been unwillingly selected without any reasonable arguments only when the assignments were necessary in calculating the cross section. Therefore, it is very desirable for our purpose to obtain more accurate information of the nuclear structure of FP nuclides.

We wish to propose the level schemes of about 100 important nuclides in the near future as the next step of this evaluation work.

Acknowledgement

The authors would like to express their appreciation to Dr. S. Iijima and other members of Fission Product Nuclear Data Working Group of Japanese Nuclear Data Committee for their advices and discussions. We are very grateful to Dr. S. Igarasi and Mr. Y. Nakagawa for their discussions and helps for calculation of the neutron cross sections.

 $N(E) - 2 = k \cdot e^{(E-E_0')/T}$.

Table 2 Partial cross section of inelastic scattering of neutron on each level of ^{101}Ru are tabulated for neutron energies of 0.5, 0.7 and 1.0 MeV. The first three columns are our level schemes, proposed previously and revised recently and those proposed by Gruppelaar, respectively. The next three columns are the partial cross section for each level in the three level schemes. The integrated inelastic scattering and capture cross sections are given in the last two lines for comparison.
