Evaluation of Neutron Nuclear Data for ^{12}C

Keiichi SHIBATA

Department of Physics, Tokai Research Establishment, JAERI

(Received November 22, 1983)

Neutron nuclear data of ^{12}C have been evaluated for JENDL-3 in the energy range from 10^{-5} eV to 20 MeV. Evaluated quantities are the total, elastic and inelastic scattering, radiative capture, photon-production, (n,p) , (n,d) and (n,α) reaction cross sections and the angular or energy distribution of neutrons and photons. The total cross section below the threshold energy of the inelastic scattering has been calculated on the basis of the R-matrix theory. Three discrete levels have been taken into account for the inelastic scattering.

1. Introduction

Neutron nuclear data of ^{12}C are important for transport calculations in fusion and fission reactors. Although these data are included in JENDL-1 and JENDL-2 (first and second versions of Japanese Evaluated Nuclear Data Library), the evaluated data are mainly based on ENDF/B-IV except for the total and elastic scattering cross sections below 2 MeV and the radiative capture cross section. The evaluation for ENDF/B-IV was made in 1973. Since then many measurements on ^{12}C have been performed. Thus, it was decided to re-evaluate the data of ^{12}C in order to raise the quality and reliability of the evaluated data.

The R-matrix theory is useful for analyses of neutron induced reactions on light nuclei such as Li, B, C and O. Recently, we developed a computer code based on the R-matrix theory. In the present work, this code has been used to calculate the total cross section and the elastic angular distribution.

This report describes the procedure and the results of the re-evaluation for each reaction. The present evaluated data are compiled in the ENDF/B format, and they are listed in Appendix.

2. Total Cross Section

The total cross section of ^{12}C has been measured by many groups.

The measurements after 1970 are the following:

Meadows and Whalen ¹⁾	(1970); 0.1 MeV ~ 1.5 MeV,
Foster, Jr. and Glasgow ²⁾	(1971); 2.5 MeV ~ 15 MeV,
Perey et al. ³⁾	(1972); 0.2 MeV ~ 20 MeV,
Cabe and Cance ⁴⁾	(1973); 0.1 MeV ~ 6 MeV,
Stooksberry and Anderson ⁵⁾	(1973); 0.4 MeV ~ 2.4 MeV,
Fasoli et al. ⁶⁾	(1973); 2.1 MeV ~ 4.7 MeV,
Mubarakmand et al. ⁷⁾	(1974); 1.7 MeV ~ 14.7 MeV,
Heaton, II et al. ⁸⁾	(1975); 1 keV ~ 15 MeV,
Nishimura et al. ⁹⁾	(1977); 20 keV ~ 240 keV,
Smith et al. ¹⁰⁾	(1979); 0.1 MeV ~ 4.5 MeV,
Lamaze et al. ¹¹⁾	(1979); 3 MeV ~ 40 MeV,
Auchampaugh et al. ¹²⁾	(1979); 1 MeV ~ 14 MeV,
Cierjacks et al. ¹³⁾	(1980); 3 MeV ~ 30 MeV.

In the keV region, Heaton, II et al.⁸⁾ measured the cross section with an experimental uncertainty of ~1%, and their data are consistent with other data^{1,4,5,9,10)}. The data of Perey et al.³⁾ fluctuate considerably in the energy range from 180 keV to 500 keV. In the MeV region, Lamaze et al.¹¹⁾, Auchampaugh et al.¹²⁾ and Cierjacks et al.¹³⁾ presented a huge amount of data with high resolution. In the present evaluation the energy range of the total cross section was divided into three regions, and different methods of evaluation were employed in each energy region.

2.1 Below 10 eV

In this region, the total cross section was obtained by summing up the radiative capture and elastic scattering cross sections described in the following sections.

2.2 Between 10 eV and 4.8 MeV

The cross section was calculated on the basis of the R-matrix theory^{14,15)} using the computer code RESCAL¹⁶⁾. The R-matrix is given by

$$R_{c',c}^{J\pi} = R_c^{\infty J\pi} \delta_{c',c} + \sum_{\lambda} \gamma_{\lambda c}^{J\pi} \gamma_{\lambda c}^{J\pi} / (E_{\lambda}^{J\pi} - E), \quad (1)$$

where c' and c are conventional channel indices, $\gamma_{\lambda}^{J\pi}$ the reduced width amplitude and $E_{\lambda}^{J\pi}$ the energy eigenvalue. Symbol $R_c^{\infty J\pi}$ represents a diagonal component of distant level contributions, and it consists of two terms, i.e.,

$$R_c^{\infty J\pi} = R_{c0}^{\infty J\pi} + R_{c1}^{\infty J\pi} \cdot E_n, \quad (2)$$

where both $R_{c0}^{\infty J\pi}$ and $R_{c1}^{\infty J\pi}$ are assumed to be real constants and E_n stands for the incident neutron energy. The collision matrix is written in terms of the R-matrix parameters as follows:

$$U_{c',c}^{J\pi} = \exp\{i(\omega_{c'} + \omega_c)\} \cdot W_{c',c}^{J\pi}, \quad (3)$$

where

$$W_{c',c}^{J\pi} = \delta_{c',c} + 2i \sqrt{P}_c (\Xi_c^{\infty J\pi} \delta_{c',c} + \sum_{\lambda\mu} \alpha_{\lambda c}^{J\pi} \alpha_{\mu c}^{J\pi} A_{\lambda\mu}^{J\pi}) \sqrt{P}_c. \quad (4)$$

Symbols used in eqs. (3) and (4) are,

$$\omega_c = \sigma_c - \phi_c , \quad (5)$$

$$\Xi_c^{\infty J\pi} = (1 - R_c^{\infty J\pi} L_c^{0J\pi})^{-1} R_c^{\infty J\pi} , \quad (6)$$

$$\alpha_{\lambda c}^{J\pi} = (1 - R_c^{\infty J\pi} L_c^{0J\pi})^{-1} \gamma_{\lambda c}^{J\pi} , \quad (7)$$

$$L_c^{0J\pi} = S_c - B_c^{J\pi} + i P_c , \quad (8)$$

$$A_{ii}^{J\pi} = \varepsilon_i^{J\pi} , \quad (9)$$

and

$$A_{ik}^{J\pi} = -\xi_{ik}^{J\pi} \quad (i \neq k) , \quad (10)$$

where

$$\varepsilon_{\lambda}^{J\pi} = E_{\lambda}^{J\pi} - E - \xi_{\lambda\lambda}^{J\pi} , \quad (11)$$

$$\xi_{\lambda\mu}^{J\pi} = \sum_c L_c^{0J\pi} (1 - R_c^{\infty J\pi} L_c^{0J\pi})^{-1} \gamma_{\lambda c}^{J\pi} \gamma_{\mu c}^{J\pi} . \quad (12)$$

Physical meaning of some parameters used here is,

σ_c : Coulomb phase shift

ϕ_c : hard sphere phase shift

S_c : shift factor

P_c : penetration factor

$B_c^{J\pi}$: logarithmic derivative involved in the specification of the real boundary condition.

In RESCAL, $B_c^{J\pi}$ is determined by

$$B_c^{J\pi} = S_c (E^{J\pi} + Q_c) , \quad (13)$$

where Q_c is the Q-value and $E^{J\pi}$ is an arbitrary value to be given as an input.

The transition matrix $T_{c',c}^{J\pi}$ is related to the collision matrix $U_{c',c}^{J\pi}$ by

$$T_{c',c}^{J\pi} = \delta_{c',c} - U_{c',c}^{J\pi}. \quad (14)$$

In the channel-spin coupling scheme, c represents a set of quantities $\{\alpha s \ell\}$, where s is the channel spin, ℓ is the orbital angular momentum and α defines a pair of nuclei. In this coupling, the total cross section is given by

$$\sigma_{\text{tot}} = \frac{\pi}{k_\alpha^2} \sum_J \frac{2(2J+1)}{(2I_1+1)(2I_2+1)} \sum_{s\ell} \text{Real Part } [T_{\alpha s \ell, \alpha s \ell}^{J\pi}], \quad (15)$$

where I_1 and I_2 are spins of the projectile and target nucleus, respectively, and k_α the wave number for the incident channel.

Initial guess-values of the R-matrix parameters were taken from the analysis by Smith et al.¹⁰⁾. By using the try-and-error method, the final values of parameters were obtained so as to give the best fit to the experimental data^{1,4,5,8-10)}, and they are given in Table I. Figures 1-3 show the calculated results together with ENDF/B-IV and -V. The peak values of two sharp resonances around 2.1 MeV and 2.8 MeV are given as follows:

Present work	6.04489 barns at 2.077 MeV
	5.26695 barns at 2.815 MeV
ENDF/B-V	6.04350 barns at 2.077 MeV
	5.07100 barns at 2.815 MeV
ENDF/B-IV	6.02330 barns at 2.0778 MeV.

In ENDF/B-IV, there is no resonance around 2.1 MeV, because experimental data indicating its existence were not available in 1973 when the evaluation was done.

2.3 Above 4.8 MeV

The evaluated cross section was obtained from the measurements of Lamaze et al.¹¹⁾, Auchampaugh et al.¹²⁾ and Cierjacks et al.¹³⁾ by using the spline function. Figures 4 and 5 show the present results.

3. Elastic Scattering

3.1 Below 10 eV

As for the thermal cross section, Koester et al.¹⁷⁾ obtained a value of 4.7456 b by using the Christiansen filter technique. The fourth edition of BNL-325¹⁸⁾ recommended a value of 4.746 b. We also adopted this recommended value in the energy range from 10^{-5} eV to 10 eV. The angular distribution was assumed to be isotropic in the center-of-mass system (CM), and this assumption was verified by the R-matrix calculation.

3.2 Between 10 eV and 4.8 MeV

The elastic scattering cross section was given as the difference between the total and radiative capture cross sections.

The angular distribution was obtained from the R-matrix calculations described in Sect. 2.2. It is given by the following form:

$$\frac{d\sigma_{\alpha',\alpha}}{d\Omega_{\alpha'}} = \frac{1}{4\pi} \sum_L B_L(\alpha',\alpha) P_L(\cos\theta_{\alpha'}) . \quad (16)$$

The Legendre coefficient $B_L(\alpha',\alpha)$ is written in terms of the transition matrix as follows:

$$B_L(\alpha',\alpha) = \frac{\pi}{k_\alpha^2} \frac{1}{(2I_1+1)(2I_2+1)} \sum_{s's} (-1)^{s'-s} \\ \times \sum_{J_1 J_2} \sum_{\ell_1 \ell_2} \sum_{\ell'_1 \ell'_2} Z(\ell_1 J_1 \ell_2 J_2; sL) Z(\ell'_1 J_1 \ell'_2 J_2; s'L)$$

2.3 Above 4.8 MeV

The evaluated cross section was obtained from the measurements of Lamaze et al.¹¹⁾, Auchampaugh et al.¹²⁾ and Cierjacks et al.¹³⁾ by using the spline function. Figures 4 and 5 show the present results.

3. Elastic Scattering

3.1 Below 10 eV

As for the thermal cross section, Koester et al.¹⁷⁾ obtained a value of 4.7456 b by using the Christiansen filter technique. The fourth edition of BNL-325¹⁸⁾ recommended a value of 4.746 b. We also adopted this recommended value in the energy range from 10^{-5} eV to 10 eV. The angular distribution was assumed to be isotropic in the center-of-mass system (CM), and this assumption was verified by the R-matrix calculation.

3.2 Between 10 eV and 4.8 MeV

The elastic scattering cross section was given as the difference between the total and radiative capture cross sections.

The angular distribution was obtained from the R-matrix calculations described in Sect. 2.2. It is given by the following form:

$$\frac{d\sigma_{\alpha',\alpha}}{d\Omega_{\alpha'}} = \frac{1}{4\pi} \sum_L B_L(\alpha',\alpha) P_L(\cos\theta_{\alpha'}) . \quad (16)$$

The Legendre coefficient $B_L(\alpha',\alpha)$ is written in terms of the transition matrix as follows:

$$B_L(\alpha',\alpha) = \frac{\pi}{k_\alpha^2} \frac{1}{(2I_1+1)(2I_2+1)} \sum_{s's} (-1)^{s'-s} \\ \times \sum_{J_1 J_2} \sum_{\ell_1 \ell_2} \sum_{\ell'_1 \ell'_2} Z(\ell_1 J_1 \ell_2 J_2; sL) Z(\ell'_1 J_1 \ell'_2 J_2; s'L)$$

$$\times \text{Real Part } [T_{\alpha's'\ell_1', \text{as}\ell_1}^{J_1 \pi_1} T_{\alpha's'\ell_2', \text{as}\ell_2}^{J_2 \pi_2}]^*, \quad (17)$$

where the Z coefficient is defined as usual.

3.3 Above 4.8 MeV

The cross section was obtained by subtracting the reaction cross section from the total cross section.

The angular distribution was evaluated on the basis of the following experimental data:

Deconninck and Meuldres ¹⁹⁾	(1970); 17 MeV	\sim 20 MeV,
Galati et al. ²⁰⁾	(1972); 3 MeV	\sim 7 MeV,
Velkley et al. ²¹⁾	(1973); 7 MeV	\sim 9 MeV,
Haouat et al. ²²⁾	(1975); 8 MeV	\sim 14.5 MeV,
Thumm et al. ²³⁾	(1980); 15 MeV	\sim 18 MeV.

The elastic scattering cross sections and the R-matrix calculations of the angular distributions are shown in Figs. 6 - 10 by comparing with experimental data^{10,19,21,22,24-29)}.

4. Inelastic Scattering

4.1 4.44 MeV Level

The first excited state of ^{12}C ($J^\pi=2^+$) decays into the ground state ($J^\pi=0^+$) by emitting γ -rays. The angular distribution of γ -rays is given by

$$\frac{d\sigma_{n,n'\gamma}}{d\Omega_\gamma} = \frac{\sigma_{n,n'\gamma}}{4\pi} [1 + 5a_2 P_2(\cos\theta_\gamma) + 9a_4 P_4(\cos\theta_\gamma)], \quad (18)$$

where P_2 and P_4 are the second- and fourth-order Legendre polynomials,

$$\times \text{Real Part } [T_{\alpha's'\ell_1', \text{as}\ell_1}^{J_1 \pi_1} T_{\alpha's'\ell_2', \text{as}\ell_2}^{J_2 \pi_2}]^*, \quad (17)$$

where the Z coefficient is defined as usual.

3.3 Above 4.8 MeV

The cross section was obtained by subtracting the reaction cross section from the total cross section.

The angular distribution was evaluated on the basis of the following experimental data:

Deconninck and Meuldres ¹⁹⁾	(1970); 17 MeV	\sim 20 MeV,
Galati et al. ²⁰⁾	(1972); 3 MeV	\sim 7 MeV,
Velkley et al. ²¹⁾	(1973); 7 MeV	\sim 9 MeV,
Haouat et al. ²²⁾	(1975); 8 MeV	\sim 14.5 MeV,
Thumm et al. ²³⁾	(1980); 15 MeV	\sim 18 MeV.

The elastic scattering cross sections and the R-matrix calculations of the angular distributions are shown in Figs. 6 - 10 by comparing with experimental data^{10,19,21,22,24-29)}.

4. Inelastic Scattering

4.1 4.44 MeV Level

The first excited state of ^{12}C ($J^\pi=2^+$) decays into the ground state ($J^\pi=0^+$) by emitting γ -rays. The angular distribution of γ -rays is given by

$$\frac{d\sigma_{n,n'\gamma}}{d\Omega_\gamma} = \frac{\sigma_{n,n'\gamma}}{4\pi} [1 + 5a_2 P_2(\cos\theta_\gamma) + 9a_4 P_4(\cos\theta_\gamma)], \quad (18)$$

where P_2 and P_4 are the second- and fourth-order Legendre polynomials,

respectively. Neglecting the fourth-order term, the cross section for the $(n, n'\gamma)$ reaction is estimated from the measurement at 125° where P_2 is zero, i.e.,

$$\sigma_{n,n'\gamma} = 4\pi \frac{d\sigma_{n,n'\gamma}}{d\Omega_\gamma} \Big|_{\theta_\gamma=125^\circ}. \quad (19)$$

Morgan et al.³⁰⁾ measured these differential cross sections from 4.8 MeV to 19 MeV with a NaI(Tl) detector at two angles of 90° and 125° . Rogers et al.³¹⁾ also measured them at an angle of 125° . Both data are consistent with each other. We adopted the data of Morgan et al. here, since the angular distribution of γ -rays as well as the cross section could be extracted from them.

The angular distribution of neutrons was derived from the experimental data¹⁹⁻²³⁾.

4.2 7.65 MeV Level

There are several experimental data³²⁻³⁶⁾ only around 14 MeV. Thus, the cross section was estimated so that the elastic scattering cross section given as the difference between the total and reaction cross sections might be consistent with experimental data.

The angular distribution was calculated with distorted-wave Born approximation (DWBA) using the computer code DWUCK4³⁷⁾. The optical-model potential parameters were taken from the analysis by Thumm and Lesiecki³⁸⁾, and the parameters are listed in Table II.

4.3 9.64 MeV Level

In the case of the third level, there are several measurements^{32, 33, 35, 36, 39, 40)} around 14 MeV. Recently, Antolković et al.⁴¹⁾ measured the three α -correlation spectra from the $^{12}\text{C}(n, 3\alpha)n$ reaction between 10

and 35 MeV by using the nuclear emulsion, and they deduced the excitation function for the inelastic scattering to the third excited state of ^{12}C with kinematical analysis. The evaluation was done on the basis of their data by smoothing them.

The angular distribution was calculated with DWBA, as described in the above subsection.

4.4 Continuous Levels

The inelastic scattering to the excited states of ^{12}C higher than 10.3 MeV and other reactions which lead to the final state of $3\alpha + n$ were considered as the inelastic scattering to the continuous levels. Antolković et al.⁴¹⁾ measured the $(n, 3\alpha)n$ cross section in a kinematically complete experiment, and their data are consistent with the old works^{42,43)}. Owing to the experimental energy cut-off, however, the events due to the decay via the second excited state of ^{12}C (7.65 MeV) were unable to be detected. Therefore, we considered the contribution from the continuum as the difference between the measured $^{12}\text{C}(n, 3\alpha)n$ cross section and the $^{12}\text{C}(n, n')^{12}\text{C}^*$ (9.64 MeV) cross section evaluated above.

The angular distribution was assumed to be isotropic in CM. As the energy distribution the evaporation spectrum was assumed. The value of nuclear temperature θ was determined on the basis of the OKTAVIAN data⁴⁴⁾ at 14.7 MeV. For other energies the following expression was assumed:

$$\theta = (E_n/a)^{1/2}, \quad (20)$$

where a is a constant.

Figures 11-16 show the evaluated cross sections. For the inelastic scattering to the first excited state, ENDF/B-V gives a fine structure around 14.8 MeV as shown in Fig. 11. This structure comes from some experimental data^{32,33,45)}. However, there is no such a structure from the excitation functions obtained by Morgan et al.³⁰⁾ and Rogers et al.³¹⁾. Thus, it has not been taken into account in the present work.

In Figs.15 and 16, are shown the angular distributions at 14 MeV by comparing with ENDF/B-V and experimental data^{32,33,39,40,44,46)}. The calculated angular distribution for the inelastic scattering to the second excited state (7.65 MeV) is in good agreement with the most recent data of Takahashi et al.⁴⁴⁾, as shown in Fig. 15. On the other hand, it was found that the DWBA result did not reproduce satisfactorily the whole pattern of the data of Takahashi et al. in the case of the third excited state (9.64 MeV).

5. Radiative Capture Reaction

As the thermal cross section we adopted a value of 3.53 mb which was recommended in BNL-325¹⁸⁾. The cross section was extrapolated as $1/v$ up to 100 keV, i.e.,

$$\sigma_{n,\gamma} = 5.61 \times 10^{-4} [E_n (\text{eV})]^{-1/2} (\text{barns}). \quad (21)$$

Above 100 keV, the inverse reaction data of Cook⁴⁷⁾ were added by using the detailed balance. The result is shown in Fig. 17 together with experimental data^{48,49)} and the evaluated data in ENDF/B-IV and -V. It is noted that the (n,γ) cross section in ENDF/B-IV is equal to zero above 4.0 keV.

Figures 11-16 show the evaluated cross sections. For the inelastic scattering to the first excited state, ENDF/B-V gives a fine structure around 14.8 MeV as shown in Fig. 11. This structure comes from some experimental data^{32,33,45)}. However, there is no such a structure from the excitation functions obtained by Morgan et al.³⁰⁾ and Rogers et al.³¹⁾. Thus, it has not been taken into account in the present work.

In Figs.15 and 16, are shown the angular distributions at 14 MeV by comparing with ENDF/B-V and experimental data^{32,33,39,40,44,46)}. The calculated angular distribution for the inelastic scattering to the second excited state (7.65 MeV) is in good agreement with the most recent data of Takahashi et al.⁴⁴⁾, as shown in Fig. 15. On the other hand, it was found that the DWBA result did not reproduce satisfactorily the whole pattern of the data of Takahashi et al. in the case of the third excited state (9.64 MeV).

5. Radiative Capture Reaction

As the thermal cross section we adopted a value of 3.53 mb which was recommended in BNL-325¹⁸⁾. The cross section was extrapolated as $1/v$ up to 100 keV, i.e.,

$$\sigma_{n,\gamma} = 5.61 \times 10^{-4} [E_n (\text{eV})]^{-1/2} (\text{barns}). \quad (21)$$

Above 100 keV, the inverse reaction data of Cook⁴⁷⁾ were added by using the detailed balance. The result is shown in Fig. 17 together with experimental data^{48,49)} and the evaluated data in ENDF/B-IV and -V. It is noted that the (n,γ) cross section in ENDF/B-IV is equal to zero above 4.0 keV.

6. The $^{12}\text{C}(\text{n},\text{p})^{12}\text{B}$ Reaction

Rimmer and Fisher⁵⁰⁾ measured the excitation function in the energy range of 14.5 MeV to 22 MeV by the activation method. Bobyr et al.⁵¹⁾ also measured the cross section from 16 MeV to 18 MeV by the same method, but their data are twice as large as those of Rimmer and Fisher. Since the measured data of Rimmer and Fisher covered the whole energy range which was required, we adopted them as the (n,p) cross section for the present. The evaluated curve is shown in Fig. 18.

7. The $^{12}\text{C}(\text{n},\text{d})^{11}\text{B}$ Reaction

There are no available data on the (n,d) reaction but the inverse reaction data. Hence, the (n,d) cross section was calculated with DWBA by assuming the proton pickup mechanism. As the neutron potential, the same parameters described in Sect. 4.2 were employed. Concerning the deuteron potential we used the parameters of Fuchs et al.⁵²⁾, and they are listed in Table III. The bound state wave-function for the p + ^{11}B system was calculated by the conventional separation-energy method, and the form factor parameters are given in Table IV. Normalization was taken so that the cross section at 17.5 MeV might give a value of 26 mb which was estimated from the inverse reaction data⁵³⁾. The calculated result is shown in Fig. 19.

8. The $^{12}\text{C}(\text{n},\alpha)^9\text{Be}$ Reaction

The (n, α) reactions leading to the excited states of ^9Be contribute to the (n,n'3 α) reaction. Thus, only the evaluation on the (n,α_0) reaction is needed here. Available experimental data are the following:

6. The $^{12}\text{C}(\text{n},\text{p})^{12}\text{B}$ Reaction

Rimmer and Fisher⁵⁰⁾ measured the excitation function in the energy range of 14.5 MeV to 22 MeV by the activation method. Bobyr et al.⁵¹⁾ also measured the cross section from 16 MeV to 18 MeV by the same method, but their data are twice as large as those of Rimmer and Fisher. Since the measured data of Rimmer and Fisher covered the whole energy range which was required, we adopted them as the (n,p) cross section for the present. The evaluated curve is shown in Fig. 18.

7. The $^{12}\text{C}(\text{n},\text{d})^{11}\text{B}$ Reaction

There are no available data on the (n,d) reaction but the inverse reaction data. Hence, the (n,d) cross section was calculated with DWBA by assuming the proton pickup mechanism. As the neutron potential, the same parameters described in Sect. 4.2 were employed. Concerning the deuteron potential we used the parameters of Fuchs et al.⁵²⁾, and they are listed in Table III. The bound state wave-function for the $\text{p} + ^{11}\text{B}$ system was calculated by the conventional separation-energy method, and the form factor parameters are given in Table IV. Normalization was taken so that the cross section at 17.5 MeV might give a value of 26 mb which was estimated from the inverse reaction data⁵³⁾. The calculated result is shown in Fig. 19.

8. The $^{12}\text{C}(\text{n},\alpha)^9\text{Be}$ Reaction

The (n,α) reactions leading to the excited states of ^9Be contribute to the ($\text{n},\text{n}'3\alpha$) reaction. Thus, only the evaluation on the (n,α_0) reaction is needed here. Available experimental data are the following:

6. The $^{12}\text{C}(\text{n},\text{p})^{12}\text{B}$ Reaction

Rimmer and Fisher⁵⁰⁾ measured the excitation function in the energy range of 14.5 MeV to 22 MeV by the activation method. Bobyr et al.⁵¹⁾ also measured the cross section from 16 MeV to 18 MeV by the same method, but their data are twice as large as those of Rimmer and Fisher. Since the measured data of Rimmer and Fisher covered the whole energy range which was required, we adopted them as the (n,p) cross section for the present. The evaluated curve is shown in Fig. 18.

7. The $^{12}\text{C}(\text{n},\text{d})^{11}\text{B}$ Reaction

There are no available data on the (n,d) reaction but the inverse reaction data. Hence, the (n,d) cross section was calculated with DWBA by assuming the proton pickup mechanism. As the neutron potential, the same parameters described in Sect. 4.2 were employed. Concerning the deuteron potential we used the parameters of Fuchs et al.⁵²⁾, and they are listed in Table III. The bound state wave-function for the p + ^{11}B system was calculated by the conventional separation-energy method, and the form factor parameters are given in Table IV. Normalization was taken so that the cross section at 17.5 MeV might give a value of 26 mb which was estimated from the inverse reaction data⁵³⁾. The calculated result is shown in Fig. 19.

8. The $^{12}\text{C}(\text{n},\alpha)^9\text{Be}$ Reaction

The (n, α) reactions leading to the excited states of ^9Be contribute to the (n,n'3 α) reaction. Thus, only the evaluation on the (n,α_0) reaction is needed here. Available experimental data are the following:

Chatterjee and Sen ⁵⁴⁾	(1964); 14.5 MeV,
Huck et al. ⁵⁵⁾	(1966); 16 and 17 MeV,
Brendle et al. ⁵⁶⁾	(1968); 13.9 and 15.6 MeV,
Kitazawa and Yamamuro ⁵⁷⁾	(1969); 14.1 MeV,
Kardonsky et al. ⁵⁸⁾	(1971); 14.3 MeV,
Stevens ⁵⁹⁾	(1976); 18 ~ 22 MeV,

Retz-Schmidt et al. ⁶⁰⁾	(1960); 7.6 ~ 10.4 MeV ^{*)} ,
Verbinski et al. ⁶¹⁾	(1968); 11.3 ~ 13.6 MeV ^{*)} ,
Obst et al. ⁶²⁾	(1972); 9.2 ~ 11 MeV ^{*)} .

The evaluation was done on the basis of these data by using the spline-function fitting. The evaluated curve is displayed in Fig. 20.

9. Photon Production

9.1 The $^{12}\text{C}(\text{n}, \text{n}'\gamma) ^{12}\text{C}^*$ Reaction

The differential cross section for the $(\text{n}, \text{n}'\gamma)$ reaction was measured by Morgan et al.³⁰⁾. The integrated cross section is the same as given in eq. (19). The second-order Legendre coefficient a_2 in eq. (18) can be obtained by neglecting the fourth-order term, i.e.,

$$a_2 = \frac{2}{5} [1 - \frac{d\sigma_{n,n'\gamma}}{d\Omega_\gamma}|_{\theta_\gamma=90^\circ} / \frac{d\sigma_{n,n'\gamma}}{d\Omega_\gamma}|_{\theta_\gamma=125^\circ}] . \quad (22)$$

9.2 The $^{12}\text{C}(\text{n}, \gamma) ^{13}\text{C}$ Reaction

Spilling et al.⁶³⁾ measured the capture γ -ray spectrum for thermal

*) These energies correspond to the incident neutron energies.

$^{12}\text{C}(\text{n}, \alpha_0) ^9\text{Be}$	
Chatterjee and Sen ⁵⁴⁾	(1964); 14.5 MeV,
Huck et al. ⁵⁵⁾	(1966); 16 and 17 MeV,
Brendle et al. ⁵⁶⁾	(1968); 13.9 and 15.6 MeV,
Kitazawa and Yamamuro ⁵⁷⁾	(1969); 14.1 MeV,
Kardonsky et al. ⁵⁸⁾	(1971); 14.3 MeV,
Stevens ⁵⁹⁾	(1976); 18 ~ 22 MeV,
$^9\text{Be}(\alpha, n_0) ^{12}\text{C}$	
Retz-Schmidt et al. ⁶⁰⁾	(1960); 7.6 ~ 10.4 MeV ^{*)} ,
Verbinski et al. ⁶¹⁾	(1968); 11.3 ~ 13.6 MeV ^{*)} ,
Obst et al. ⁶²⁾	(1972); 9.2 ~ 11 MeV ^{*)} .

The evaluation was done on the basis of these data by using the spline-function fitting. The evaluated curve is displayed in Fig. 20.

9.1 The $^{12}\text{C}(\text{n}, \text{n}'\gamma) ^{12}\text{C}^*$ Reaction

The differential cross section for the $(\text{n}, \text{n}'\gamma)$ reaction was measured by Morgan et al.³⁰⁾. The integrated cross section is the same as given in eq. (19). The second-order Legendre coefficient a_2 in eq. (18) can be obtained by neglecting the fourth-order term, i.e.,

$$a_2 = \frac{2}{5} [1 - \frac{d\sigma_{n,n'\gamma}}{d\Omega_\gamma}|_{\theta_\gamma=90^\circ} / \frac{d\sigma_{n,n'\gamma}}{d\Omega_\gamma}|_{\theta_\gamma=125^\circ}] . \quad (22)$$

9.2 The $^{12}\text{C}(\text{n}, \gamma) ^{13}\text{C}$ Reaction

Spilling et al.⁶³⁾ measured the capture γ -ray spectrum for thermal

*) These energies correspond to the incident neutron energies.

neutrons with a high-resolution Ge(Li) detector, and determined the intensities of the γ -rays. We deduced γ -ray multiplicities from their data. The result is the following:

Transition	Multiplicity
cap. \rightarrow g.s.	0.68
cap. \rightarrow 3.68 MeV	0.32
3.68 MeV \rightarrow g.s.	0.32

The angular distribution of γ -rays was assumed to be isotropic.

10. Concluding Remarks

Evaluation of neutron nuclear data for ^{12}C has been performed in the energy range from 10^{-5} eV to 20 MeV.

The R-matrix theory was employed to analyze the total cross section below 4.8 MeV. Using the best-fit R-matrix parameters, the calculated angular distribution for the elastic scattering is in good agreement with experimental data. The experimental data on the inelastic scattering to the levels higher than 7.65 MeV are very scarce. Thus, new measurements are necessary for fusion neutronics calculations.
