Evaluation of Neutron Nuclear Data of ^{241}Pu for JENDL-2

Yasuyuki KIKUCHI and Nobuo SEKINE*

Department of Physics

Tokai Research Establishment, JAERI

(Received May 25, 1984)

Neutron nuclear data of ^{241}Pu were newly evaluated for JENDL-2.

Evaluated quantities are the total, elastic and inelastic scattering, fission, capture, $(n,2n)$, $(n,3n)$ and $(n,4n)$ reaction cross sections, the resolved and unresolved resonance parameters, the angular and energy distributions of emitted neutrons, and the average number of neutrons emitted per fission. The simultaneous evaluation method was adopted for the fission cross section so as to keep the consistency among the main fissile and fertile material nuclides. The theoretical calculations based on the spherical optical model and the statistical model were also used, when the experimental data were not sufficient. Discussion is given on the evaluation method.

1. Introduction

Neutron nuclear data of ^{241}Pu are required to predict various characteristics of fast reactors, particularly at the high burn-up stage. Hence a new evaluation was made by Kikuchi¹⁾ for the first version of Japanese Evaluated Nuclear Data Library (JENDL-1)²⁾ in 1975.

JENDL-1 is the first standard evaluated nuclear data library in Japan and provides data for 72 nuclides from 10^{-5} eV to 15 MeV. As JENDL-1 aimed mainly at the fast reactor calculation, the evaluation was rather rough in the thermal and resonance regions. Furthermore, some drawbacks were pointed out through the benchmark tests³⁾ of JENDL-1 for both the heavy and structural material nuclides.

Under such a situation, the second version of JENDL (JENDL-2) was planned in 1976. JENDL-2 aims at wider application, such as the thermal reactor, shielding and fusion neutronics calculations. Hence the number of nuclides to be evaluated was enlarged to 176 (including 99 fission product nuclides), and the maximum energy was extended to 20 MeV. Taking account of the results of benchmark tests on JENDL-1 data, it was decided to make a complete reevaluation for the main fissile and fertile material nuclides including ^{241}Pu .

The entire compilation of JENDL-2 was scheduled to be completed in 1981. At the first stage of compilation, however, the highest priority was put to evaluation of the most important nuclides for fast reactors: ^{235}U , ^{238}U , ^{239}Pu , ^{240}Pu , ^{241}Pu , Cr, Fe and Ni. This decision was made responding to an urgent request to use JENDL-2 for analyses in the JUPITER project⁴⁾, joint USA-Japan mock-up experiments of large fast reactors using the ZPPR facility. The evaluation of the eight nuclides was completed in November 1979. Since then a combined library consisting of JENDL-2 for the eight nuclides and of JENDL-1 for the

others has been widely used for fast reactor calculations as JENDL-2B library*. Results of various benchmark tests⁵⁾ have proved the reliability of JENDL-2.

As to ²⁴¹Pu, only the resonance parameters, cross sections and angular distributions (files 2,3 and 4) were supplied to JENDL-2B with the data of ENDF/B-IV for files 1 and 5. After that the energy distributions of the secondary neutrons (file 5) and values pertaining to fission (file 1) were evaluated. Final data were released in December 1982.

This is the final report concerning the evaluation of neutron nuclear data of ²⁴¹Pu for JENDL-2. Details of the evaluation method are described as well as the experimental data on which the evaluation was based. The obtained results are compared with those of JENDL-1 and ENDF/B-IV. The problems encountered in the present work are discussed, and the subjects for future work are pointed out. A list of the numerical data in the ENDF/B format is given in Appendix.

* The nuclear data of the other important nuclides such as ¹⁰B, C, Na, Al and Si were not changed from JENDL-1 to JENDL-2. Hence the JENDL-2B library is essentially the pure JENDL-2 library.

2. Thermal Cross Sections

The cross sections below 1 eV are given as point-wise data, since the cross sections cannot be reproduced from the present resonance parameters as precisely as required from the thermal reactor calculations. The total and fission cross sections were evaluated by the eye-guide method mainly on the basis of the data measured by Smith and Young⁶⁾ and by Wagemans and Deruytter⁷⁾, respectively. The elastic scattering cross section was calculated from the resonance parameters by using the effective scattering radius of 10.0 fm, which was determined considering the 2200 m/s value recommended by Lemmel⁸⁾. The capture cross section was obtained by subtracting the fission and elastic scattering cross sections from the total cross section, as the numerical data of Weston and Todd⁹⁾ were not available at the time of the present evaluation.

The 2200 m/s values are given in Table 1. The cross sections are shown in Figs. 1~4 with the measured data as well as the evaluated data of JENDL-1 and ENDF/B-IV. The total and fission cross sections agree with the measured data and with the other evaluated data. As to the capture cross section, the present data, which were evaluated without the experimental data of Weston and Todd, look a little lower between 0.05 and 0.2 eV. The peaks observed in the measured total and capture cross sections near 1 eV and 2.5 eV are obviously due to ²⁴⁰Pu.

3. Resonance Parameters

3.1 Resolved Resonance Parameters

The resolved resonance region is from 1 eV to 100 eV. The Breit-Wigner formula, which is standard in JENDL-2, was adopted.

In the evaluation for JENDL-1, we adopted the resonance parameters recommended in BNL-325, 3rd edition¹⁰⁾, which were mainly taken from

2. Thermal Cross Sections

The cross sections below 1 eV are given as point-wise data, since the cross sections cannot be reproduced from the present resonance parameters as precisely as required from the thermal reactor calculations. The total and fission cross sections were evaluated by the eye-guide method mainly on the basis of the data measured by Smith and Young⁶⁾ and by Wagemans and Deruytter⁷⁾, respectively. The elastic scattering cross section was calculated from the resonance parameters by using the effective scattering radius of 10.0 fm, which was determined considering the 2200 m/s value recommended by Lemmel⁸⁾. The capture cross section was obtained by subtracting the fission and elastic scattering cross sections from the total cross section, as the numerical data of Weston and Todd⁹⁾ were not available at the time of the present evaluation.

The 2200 m/s values are given in Table 1. The cross sections are shown in Figs. 1~4 with the measured data as well as the evaluated data of JENDL-1 and ENDF/B-IV. The total and fission cross sections agree with the measured data and with the other evaluated data. As to the capture cross section, the present data, which were evaluated without the experimental data of Weston and Todd, look a little lower between 0.05 and 0.2 eV. The peaks observed in the measured total and capture cross sections near 1 eV and 2.5 eV are obviously due to ²⁴⁰Pu.

3. Resonance Parameters

3.1 Resolved Resonance Parameters

The resolved resonance region is from 1 eV to 100 eV. The Breit-Wigner formula, which is standard in JENDL-2, was adopted.

In the evaluation for JENDL-1, we adopted the resonance parameters recommended in BNL-325, 3rd edition¹⁰⁾, which were mainly taken from

analyses by Blons et al.¹¹⁾ and by Kolar et al.¹²⁾. It was found¹⁾ that these parameters satisfactorily reproduced the total and fission cross sections but a little underestimated the capture cross section.

In the evaluation for JENDL-2, the experimentally deduced parameters available at the time of 1977 were collected and stored in REPSTOR system¹³⁾. They are shown in Table 2. After that Weston and Todd¹⁴⁾ reported the parameters up to 100 eV, but their Adler-Adler type multi-level parameters cannot be treated in our system. As no new measurements were available after JENDL-1 except the untreatable parameters by Weston and Todd, we decided to adopt the parameters of JENDL-1 as the initial guess values.

The cross sections were calculated with the effective scattering radius of 10.0 fm. The resonance parameters were modified so that the calculated total, fission and capture cross sections might reproduce the measured data by Kolar and Carraro¹⁵⁾, by Blons¹⁶⁾ and by Weston and Todd⁹⁾, respectively. As the numerical data of Weston and Todd were not available at the time of the present evaluation, the fitting to the capture cross section was made to the resonances below 20 eV for which the peak values of Weston and Todd were read from graphs in Ref. (9). This modification was made by displaying the calculated cross sections and the measured data on a cathode ray tube with NDES (Neutron Data Evaluation System)¹⁷⁾.

The background cross sections were applied to both the fission and capture cross sections. The background fission cross section was determined by NDES so as to compensate the remaining discrepancies between the calculated and measured data due to the interference among levels. The present resonance parameters also underestimate the capture cross section a little and the discrepancy was corrected by the smooth

background cross section. Table 3 shows the average fission and capture cross sections calculated with and without the background cross sections as well as the average values of measured data. Figure 5 shows the calculated total, fission and capture cross sections with and without the background cross section as an example. The background correction has little effect on the total cross section. Figures 6 to 15 show the present total, fission and capture cross sections with the measured data as well as those of JENDL-1 and ENDF/B-IV.

3.2 Unresolved Resonance Parameters

The unresolved resonance parameters are supplied in the energy region between 100 eV and 30 keV. First the fission and capture cross sections were evaluated as will be described in the next chapter. The unresolved resonance parameters were obtained so as to reproduce the evaluated cross sections.

The initial guess parameters were determined as follows. The s- and p-wave strength functions and the effective scattering radius were obtained from the optical model calculation which will be described later. The mean level spacing and the mean radiation width were taken from the resolved resonances. The fission width was estimated²¹⁾ for each spin state with the channel theory of nuclear fission²²⁾.

First the mean level spacing was adjusted within the estimated error of 15% so as to reproduce the global trend of the cross sections. Then the strength functions and the fission widths were searched for so as to reproduce the fission and capture cross sections at each energy point. In the search, the ratio of s-wave strength function to p-wave one was kept constant. The ratios of the fission width in a spin state to those in the other states were also kept constant.

Table 4 gives the unresolved resonance parameters with the calculated cross sections.

3.3 Resonance Integrals

The resonance integrals were calculated from the present resonance parameters and the background cross sections with the cut-off energy of 3 eV. The fission and capture resonance integrals agree with the data measured by Eiland et al.²⁰⁾ as seen in Table 3.

4. Cross Sections above Resonance Region

4.1 Fission Cross Section

In the evaluation for JENDL-2, a simultaneous evaluation method was adopted²³⁾ for the data of ^{235}U , ^{238}U , ^{239}Pu , ^{240}Pu and ^{241}Pu so as to keep consistency among them, because most of new measurements have been reported as ratios to the fission cross section of ^{235}U . The method was performed as follows:

1. The fission cross section of ^{235}U is evaluated on the basis of recently measured data.
2. The cross sections of the other nuclides are deduced from the ratio data by using the fission cross section of ^{235}U .
3. The deduced cross section data are compared with absolutely measured data. If there exist some systematic discrepancies between the deduced and absolute cross sections, a way to diminish the discrepancies is suggested on the fission cross section of ^{235}U .
4. The fission cross section of ^{235}U is reevaluated by taking account of the suggestions from the other nuclides.
5. Procedures 2~4 are repeated until the consistency is obtained among all the nuclides.

Table 4 gives the unresolved resonance parameters with the calculated cross sections.

3.3 Resonance Integrals

The resonance integrals were calculated from the present resonance parameters and the background cross sections with the cut-off energy of 3 eV. The fission and capture resonance integrals agree with the data measured by Eiland et al.²⁰⁾ as seen in Table 3.

4. Cross Sections above Resonance Region

4.1 Fission Cross Section

In the evaluation for JENDL-2, a simultaneous evaluation method was adopted²³⁾ for the data of ^{235}U , ^{238}U , ^{239}Pu , ^{240}Pu and ^{241}Pu so as to keep consistency among them, because most of new measurements have been reported as ratios to the fission cross section of ^{235}U . The method was performed as follows:

1. The fission cross section of ^{235}U is evaluated on the basis of recently measured data.
2. The cross sections of the other nuclides are deduced from the ratio data by using the fission cross section of ^{235}U .
3. The deduced cross section data are compared with absolutely measured data. If there exist some systematic discrepancies between the deduced and absolute cross sections, a way to diminish the discrepancies is suggested on the fission cross section of ^{235}U .
4. The fission cross section of ^{235}U is reevaluated by taking account of the suggestions from the other nuclides.
5. Procedures 2~4 are repeated until the consistency is obtained among all the nuclides.

As to ^{241}Pu , this method was applied to the fission cross section above 10 keV. In the energy range below 10 keV, the evaluation was made by the eye-guide method mainly on the basis of the absolute measurements by Weston and Todd⁹⁾, by Carlson et al.²⁴⁾ and by Blons¹⁶⁾. Among them, the data of Weston and Todd and of Carlson et al. were published after the evaluation of JENDL-1. However they are considerably discrepant with each other as is seen in Fig. 16. As we could not find any reason to abandon one of them, the evaluation was made by averaging the three data sets with equal weights and the old data of James¹⁹⁾ and of Migneco et al.¹⁸⁾ with minor weights.

Above 10 keV, the simultaneous evaluation was made by using mainly the ratio data of Käppeler and Pfletschinger²⁵⁾, of Carlson and Behrens²⁶⁾ and of Fursov et al.²⁷⁾, and the absolute data of Szabo^{28,29)} and of Carlson et al.²⁴⁾.

The presently evaluated fission cross section is shown in Figs. 16 ~ 19 with the measured data as well as the evaluated curves of JENDL-1 and ENDF/B-IV. The present evaluated data are much affected by the ratio data as a result of the simultaneous evaluation. The present values agree with the absolute data of Szabo^{28,29)} in the energy regions below 200 keV and above 1 MeV, but are larger than those of Szabo between 200 and 800 keV. This comes from compromise in the simultaneous evaluation. From the viewpoint of ^{241}Pu , the fission cross section of ^{235}U seems too high between 200 and 800 keV, but the high values are preferable for the other nuclides. The data of Carlson et al.²⁴⁾ are systematically lower than those of Szabo, of Weston and Todd⁹⁾ and of Blons¹⁶⁾. The data of ENDF/B-IV look to be based on the data of Smith et al.³⁰⁾ and give higher values in the energy region above 1 MeV.

4.2 Total Cross Section and Optical Model

As no measured data have so far been reported for the total cross section above 1 keV, the evaluation was based on the spherical optical model calculation. The optical potential parameters were determined by taking account of systematic trends among neighboring heavy nuclides as a part of the simultaneous evaluation²³⁾. Though actinide nuclei are deformed, it was proved²³⁾ that the potential parameters adopted in JENDL-2 reproduced satisfactorily the total cross sections, the strength functions and the angular distributions of elastically scattered neutrons. The adopted optical potential parameters are:

$$\begin{aligned}
 V &= 40.25 - 0.05 E_n & \text{MeV} \\
 W_s &= 6.5 & \text{MeV} \\
 V_{so} &= 7.0 & \text{MeV} \\
 r_o &= r_{so} = 1.32 & \text{fm} \\
 r_s &= 1.38 & \text{fm} \\
 a &= b = a_{so} = 0.47 & \text{fm.}
 \end{aligned}$$

The calculated cross section joins smoothly to the measured data^{15,31)} below 1 keV as seen in Fig. 20.

4.3 Capture Cross Section

The α -values measured by Weston and Todd⁹⁾ up to 250 keV are the only available capture data. Hence the present evaluation was based on their data up to 250 keV. Above 250 keV, the statistical model calculation was applied. The γ -ray strength function of 7.51×10^{-3} was obtained so that the calculated capture cross section might be connected smoothly to the data of Weston and Todd; $\sigma_{n,\gamma} = 269 \text{ mb}$ at 250 keV. The obtained capture cross section is shown in Fig. 21.

4.4 Other Cross Sections

The $(n,2n)$, $(n,3n)$ and $(n,4n)$ reaction cross sections were calculated by the SIGNXX code³²⁾ according to Pearlstein's method³³⁾ based on the evaporation model. The neutron emission cross section approximated to the difference between the compound nucleus formation cross section and the fission cross section, because the charged particle emission and the compound elastic scattering cross sections are negligibly small.

Taking account of the $(n,2n)$, $(n,3n)$, $(n,4n)$ and fission cross sections as competing processes, the capture, elastic and inelastic scattering cross sections were calculated with the statistical model code CASTHY³⁴⁾.

The level scheme of the discrete levels was taken from Table of Isotopes, 7th edition³⁵⁾. The level density parameters were taken from the recommendation by Gilbert and Cameron³⁶⁾. The Q-values of $(n,2n)$, $(n,3n)$ and $(n,4n)$ reactions were obtained from the compilation by Wapstra and Gove³⁷⁾. These data are given in Table 5. The inelastic scattering, $(n,2n)$ and $(n,3n)$ reaction cross sections are shown in Fig. 21. The present inelastic scattering cross section is lower than that of JENDL-1, because the competing fission cross section is higher in this energy region. The inelastic scattering cross section of ENDF/B-IV was calculated with the coupled channel optical model³⁸⁾, but the competing fission process seems not to have been considered.

5. Other Quantities

5.1 Average Number of Neutrons Emitted per Fission ($\bar{\nu}$)

The datum of Boldeman and Frehaut³⁹⁾ was adopted for the number of prompt neutrons per thermal fission by assuming $\bar{\nu}_p^{(252)\text{Cf}} = 3.753$. The

4.4 Other Cross Sections

The $(n,2n)$, $(n,3n)$ and $(n,4n)$ reaction cross sections were calculated by the SIGNXX code³²⁾ according to Pearlstein's method³³⁾ based on the evaporation model. The neutron emission cross section approximated to the difference between the compound nucleus formation cross section and the fission cross section, because the charged particle emission and the compound elastic scattering cross sections are negligibly small.

Taking account of the $(n,2n)$, $(n,3n)$, $(n,4n)$ and fission cross sections as competing processes, the capture, elastic and inelastic scattering cross sections were calculated with the statistical model code CASTHY³⁴⁾.

The level scheme of the discrete levels was taken from Table of Isotopes, 7th edition³⁵⁾. The level density parameters were taken from the recommendation by Gilbert and Cameron³⁶⁾. The Q-values of $(n,2n)$, $(n,3n)$ and $(n,4n)$ reactions were obtained from the compilation by Wapstra and Gove³⁷⁾. These data are given in Table 5. The inelastic scattering, $(n,2n)$ and $(n,3n)$ reaction cross sections are shown in Fig. 21. The present inelastic scattering cross section is lower than that of JENDL-1, because the competing fission cross section is higher in this energy region. The inelastic scattering cross section of ENDF/B-IV was calculated with the coupled channel optical model³⁸⁾, but the competing fission process seems not to have been considered.

5. Other Quantities

5.1 Average Number of Neutrons Emitted per Fission ($\bar{\nu}$)

The datum of Boldeman and Frehaut³⁹⁾ was adopted for the number of prompt neutrons per thermal fission by assuming $\bar{\nu}_p(^{252}\text{Cf}) = 3.753$. The

energy dependence was determined by the data of Frehaut et al.⁴⁰⁾ and D'yachenko et al.⁴¹⁾:

$$\nu_p = 2.913 + 0.149 E_n.$$

The evaluated data are shown in Fig. 23 with the measured data.

As to the delayed neutrons, the data of Benedetti et al.⁴²⁾ were adopted for the ν_d -value, the fractions β_i and the decay constants λ_i . We assumed that the (n,n'f) process was dominant after its channel opened ($E_n \gtrsim 6$ MeV). The presently adopted ν_d -value is

$$\nu_d = 0.016 \quad \text{for } E_n \leq 5 \text{ MeV},$$

$$0.00911 \quad \text{for } E_n \geq 7 \text{ MeV},$$

and both values are linearly connected between 5 and 7 MeV.

5.2 Angular Distributions of Emitted Neutrons

The angular distributions of elastically scattered neutrons were calculated with the optical model. The isotropic scattering in the center-of-mass system was assumed for the inelastic scattering to discrete levels and the isotropic scattering in the laboratory system for the other reactions.

5.3 Energy Distributions of Emitted Neutrons

The simple evaporation spectrum was assumed for the inelastically scattered neutrons which leave the residual nucleus in continuum excited states (MT = 91). The nuclear temperature (θ) was determined as

$$\theta = T_n \quad E_n < E_x$$

$$\theta = \frac{1 + \sqrt{1 - 4a(E_n - \Delta)}}{2a} \quad E_n > E_x$$

where E_n is the incident neutron energy, and a and Δ are the level

density parameter and the pairing energy of the residual nucleus. T_n is the nuclear temperature in the constant temperature model and E_x is the joining energy between the constant temperature and Fermi gas models. These parameters are given in Table 5 (b).

As to the $(n,2n)$, $(n,3n)$ and $(n,4n)$ reactions, we assumed the successive evaporation model. For the $(n,2n)$ process, for example, the first neutron evaporates leaving the residual nucleus in an excited state higher than the neutron separation energy, and then the second neutron evaporates from the excited state. In calculating the temperature for the second neutron, we assumed that the second neutron evaporated from the excited state corresponding the average energy of the first neutron. In the ENDF/B format, the temperature of each neutron is stored independently in each subsection.

5.4 Fission Spectrum (χ)

The Maxwellian spectrum was assumed. The temperature was determined from the Z^2/A systematics obtained by Smith et al.⁴³⁾, by taking a reference ^{252}Cf average fission neutron energy of 2.13 MeV as recommended by Grundl and Eisenhauer⁴⁴⁾. The obtained temperature is 1.358 MeV. The delayed neutron spectrum was taken from ENDF/B-IV.

5.5 Fission Yield

No evaluation was done for fission yield data. The data of ENDF/B-IV were adopted.

6. Discussion

Though the quality of the presently evaluated data was proved⁵⁾ to be satisfactory, the following problems were encountered in the

density parameter and the pairing energy of the residual nucleus. T_n is the nuclear temperature in the constant temperature model and E_x is the joining energy between the constant temperature and Fermi gas models. These parameters are given in Table 5 (b).

As to the $(n,2n)$, $(n,3n)$ and $(n,4n)$ reactions, we assumed the successive evaporation model. For the $(n,2n)$ process, for example, the first neutron evaporates leaving the residual nucleus in an excited state higher than the neutron separation energy, and then the second neutron evaporates from the excited state. In calculating the temperature for the second neutron, we assumed that the second neutron evaporated from the excited state corresponding the average energy of the first neutron. In the ENDF/B format, the temperature of each neutron is stored independently in each subsection.

5.4 Fission Spectrum (χ)

The Maxwellian spectrum was assumed. The temperature was determined from the Z^2/A systematics obtained by Smith et al.⁴³⁾, by taking a reference ^{252}Cf average fission neutron energy of 2.13 MeV as recommended by Grundl and Eisenhauer⁴⁴⁾. The obtained temperature is 1.358 MeV. The delayed neutron spectrum was taken from ENDF/B-IV.

5.5 Fission Yield

No evaluation was done for fission yield data. The data of ENDF/B-IV were adopted.

6. Discussion

Though the quality of the presently evaluated data was proved⁵⁾ to be satisfactory, the following problems were encountered in the

evaluation and were left for future work.

In the thermal and resonance regions, the present evaluation did not sufficiently take account of the data by Weston and Todd, as their numerical data were not available at the time of the evaluation. Therefore the capture cross section should be a little modified in the thermal energy range.

The background correction was applied to the fission and capture cross sections in the resolved resonance region. The present resonance parameters seem to underestimate the capture cross section. Reevaluation of the parameters might be necessary. As to the fission cross section, the multi-level multi-channel formula might be required. Particularly, the Adler-Adler type parameters deduced by Weston and Todd¹⁴⁾ must be taken into account.

The simultaneous evaluation was applied²³⁾ for the important heavy nuclides. The fission cross section of ²³⁵U was determined so as to keep the best consistency between the ratio and absolute data among nuclides. Though the present value of ²³⁵U fission cross section is the results of compromise among the nuclides, its value between 200 keV and 800 keV seems too high from the viewpoint of ²⁴¹Pu fission. Furthermore recent measurements^{45,46)} of ²³⁵U fission cross section give lower values than that of JENDL-2 in this energy range. Taking account of this situation, more precise simultaneous evaluation is planned for JENDL-3.

The spherical optical model was applied in the evaluation of JENDL-2 for main fissile and fertile material nuclides, though these nuclei are heavily deformed. The spherical optical model could satisfactorily reproduce the total cross section and neutron strength functions, if adequate potential parameters be selected. However, the potential parameters thus selected contain the effect of nuclear

deformation. Hence it is not guaranteed that a potential parameter set giving good results for a nuclei gives also good results for another nuclei with different deformation. This makes systematic study very difficult. This is particularly severe for ^{241}Pu , since the potential parameters were determined from the systematic trends among neighboring nuclei.

The coupled channel optical model should be applied to avoid this difficulty. However other approximations are required to connect the coupled channel optical model with the statistical model. The coupled channel optical model can couple only several levels in the ground state band, while the statistical model requires the neutron transmission coefficients for all the levels considered. Some approximations have been already proposed^{47,48)}. We have developed a code CASECIS⁴⁹⁾, which is the combination of the coupled channel optical model code ECIS⁵⁰⁾ and the statistical model code CASTHY³⁴⁾. This code uses the transmission coefficients obtained by the coupled channel optical model for the entrance channel and those by the spherical optical model for the exit channels. This code will be used in the evaluation for JENDL-3.

7. Conclusion

Complete reevaluation was made on the neutron nuclear data of ^{241}Pu for JENDL-2. The present evaluation took account of some new experimental data published after JENDL-1. Furthermore, the simultaneous evaluation method was applied for the fission cross section so as to keep the consistency among cross sections of the main fissile and fertile materials. The values pertaining to fission such as ν and χ , which were not evaluated in JENDL-1 were also evaluated and added except the fission yield and the delayed neutron spectrum, which were taken

deformation. Hence it is not guaranteed that a potential parameter set giving good results for a nuclei gives also good results for another nuclei with different deformation. This makes systematic study very difficult. This is particularly severe for ^{241}Pu , since the potential parameters were determined from the systematic trends among neighboring nuclei.

The coupled channel optical model should be applied to avoid this difficulty. However other approximations are required to connect the coupled channel optical model with the statistical model. The coupled channel optical model can couple only several levels in the ground state band, while the statistical model requires the neutron transmission coefficients for all the levels considered. Some approximations have been already proposed^{47,48)}. We have developed a code CASECIS⁴⁹⁾, which is the combination of the coupled channel optical model code ECIS⁵⁰⁾ and the statistical model code CASTHY³⁴⁾. This code uses the transmission coefficients obtained by the coupled channel optical model for the entrance channel and those by the spherical optical model for the exit channels. This code will be used in the evaluation for JENDL-3.

7. Conclusion

Complete reevaluation was made on the neutron nuclear data of ^{241}Pu for JENDL-2. The present evaluation took account of some new experimental data published after JENDL-1. Furthermore, the simultaneous evaluation method was applied for the fission cross section so as to keep the consistency among cross sections of the main fissile and fertile materials. The values pertaining to fission such as ν and χ , which were not evaluated in JENDL-1 were also evaluated and added except the fission yield and the delayed neutron spectrum, which were taken

from ENDF/B-IV. The evaluated results were proved to be satisfactory for fast reactor calculations.

The problems encountered in the evaluation and left for future work are:

- 1) Reevaluation of resolved resonance parameters by considering the multi-level multi-channel formula.
- 2) Reevaluation of ^{235}U fission cross section in the simultaneous evaluation, by taking account of newly measured data.
- 3) Adoption of the coupled channel optical model by considering the nuclear deformation effect.

The presently evaluated data are stored in JENDL-2 with MAT number of 2945.

Acknowledgment

The authors wish to thank members of Working Group on Heavy-Nuclide Nuclear Data in JNDC for their helpful discussion. They are particularly indebted to S. Igarasi and T. Nakagawa for their advice on CASTHY and REPSTOR, respectively. They also thank T. Narita for his aid in treating numerical data. Careful typewriting by T. Maejima is much appreciated.

70	80	22.6	21.6	24.8	28.9	28.7	25.7
80	90	68.9	68.3	65.6	68.6	64.5	73.7
90	100	25.4	25.4	24.9	27.7	31.3	27.2

* Average value of the results with 11 and 50 m flight paths.

Capture cross section				(barns)		
E_{\min} (eV)	E_{\max} (eV)	Calculated		Experimental (Weston and Todd ⁹⁾)		
		with B.C.S.	without B.C.S.	α	σ_c	
10	20	81.8	69.7	0.559	83.3	\pm 5.0
20	30	18.7	16.7	0.213	17.9	\pm 1.1
30	40	10.7	10.7	0.216	10.6	\pm 0.6
40	50	7.38	4.49	0.184	7.47	\pm 0.44
50	60	3.01	1.35	0.198	3.31	\pm 0.20
60	70	14.2	7.49	0.279	15.8	\pm 0.9
70	80	15.2	15.2	0.572	12.9	\pm 0.8
80	90	22.7	20.6	0.337	23.2	\pm 1.4
90	100	5.42	4.92	0.207	5.26	\pm 0.32

* Deduced from α -values using the presently evaluated fission cross section. Errors are the quoted 6 % errors in α -values.

Resonance integral with cut-off energy of 3 eV					(barns)
Quantity	JENDL-2	JENDL-1	ENDF/B-IV	Eiland et al. ²⁰⁾	
fission	531	524	527	569 \pm 37	
capture	172	138	115	162 \pm 8	

Table 4 Energy dependence of unresolved resonance parameters and the calculated cross sections.

The energy dependence of the parameters are given as the ratio to the initial guess values listed below:

$$S_0 = 0.95 \times 10^{-4}, \quad S_1 = 1.4 \times 10^{-4}, \quad D_{\text{obs}} = 0.85 \text{ eV},$$

$$\Gamma_f^{(2+)} = 860 \text{ meV}, \quad \Gamma_f^{(3+)} = 370 \text{ meV}, \quad \Gamma_f^{(1-)} = 960 \text{ meV},$$

$$\Gamma_f^{(2-)} = 270 \text{ meV}, \quad \Gamma_f^{(3-)} = 600 \text{ meV}, \quad \Gamma_f^{(4-)} = 230 \text{ meV}.$$

Fixed parameters: $R = 9.8 \text{ fm}$, $\Gamma_\gamma = 40 \text{ meV}$.

E_n (keV)	S_0, S_1	Γ_f	D	$\sigma_{n,T}$ (barns)	$\sigma_{n,\gamma}$ (barns)	$\sigma_{n,f}$ (barns)

Table 5 Level scheme, level density parameters and Q-values.

a) Level scheme of ^{241}Pu .

No.	Energy (keV)	I^π	No.	Energy (keV)	I^π
G.S.	0	$5/2 +$	6	230.0	$9/2 +$
1	41.8	$7/2 +$	7	242.7	$7/2 +$
2	94.0	$9/2 +$	8	300	$11/2 +$
3	161.5	$1/2 +$	9	335	$9/2 +$
4	170.8	$3/2 +$	10	368	$13/2 +$
5	223.1	$5/2 +$	11	445	$11/2 -$

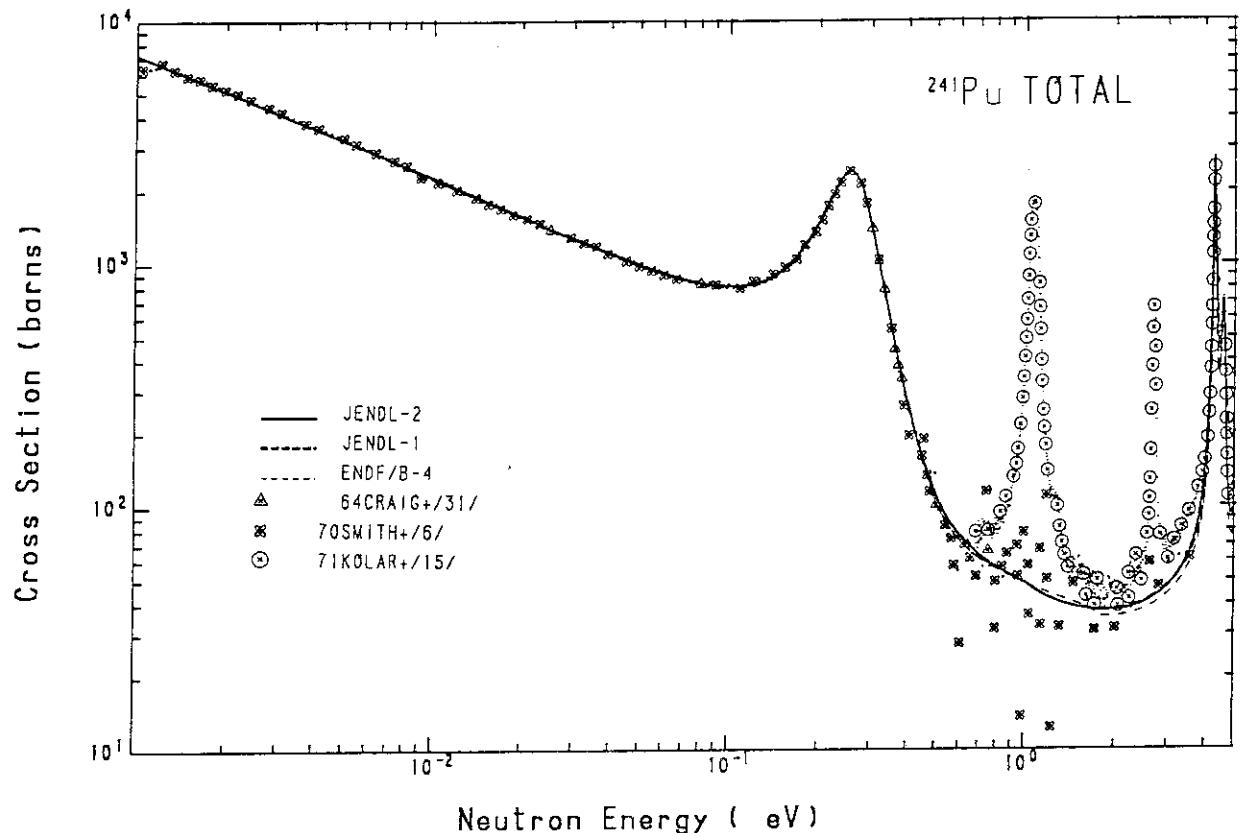

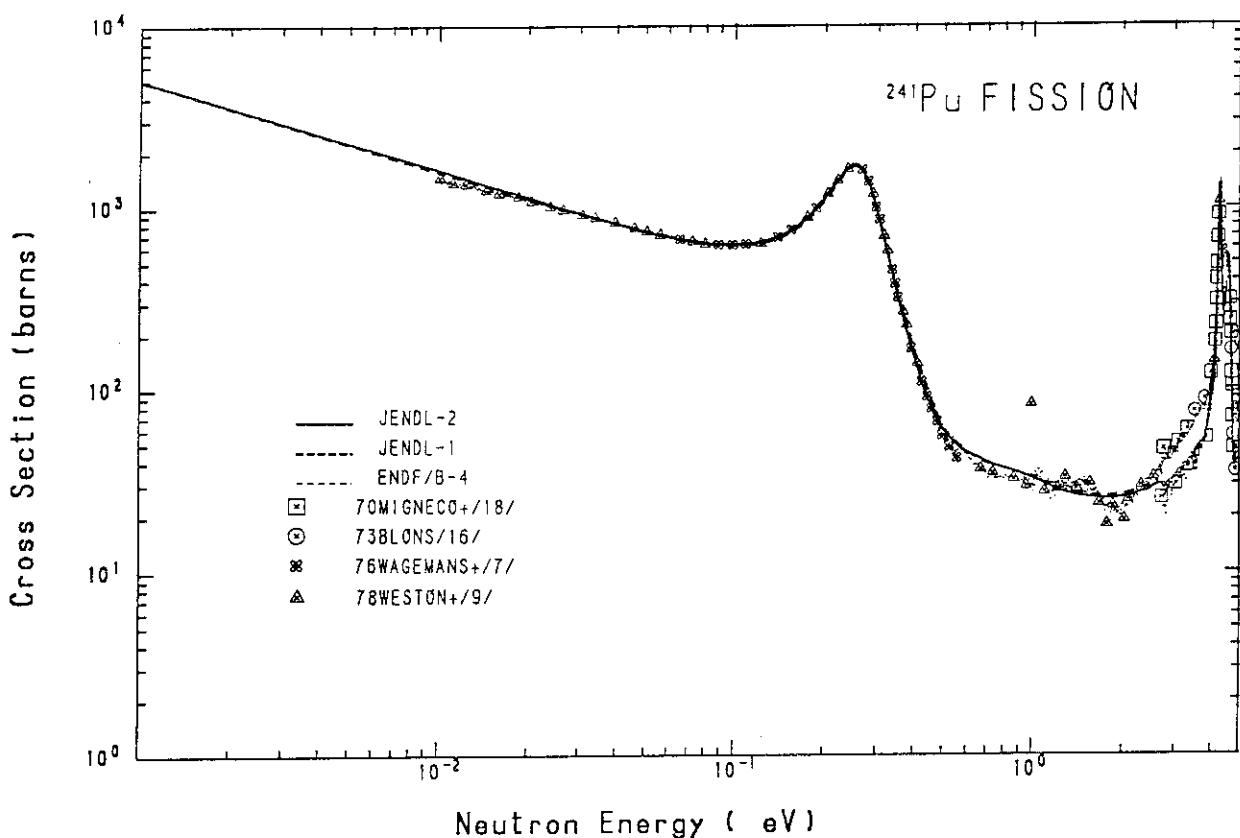

Levels above 490 keV are assumed to be continuum.

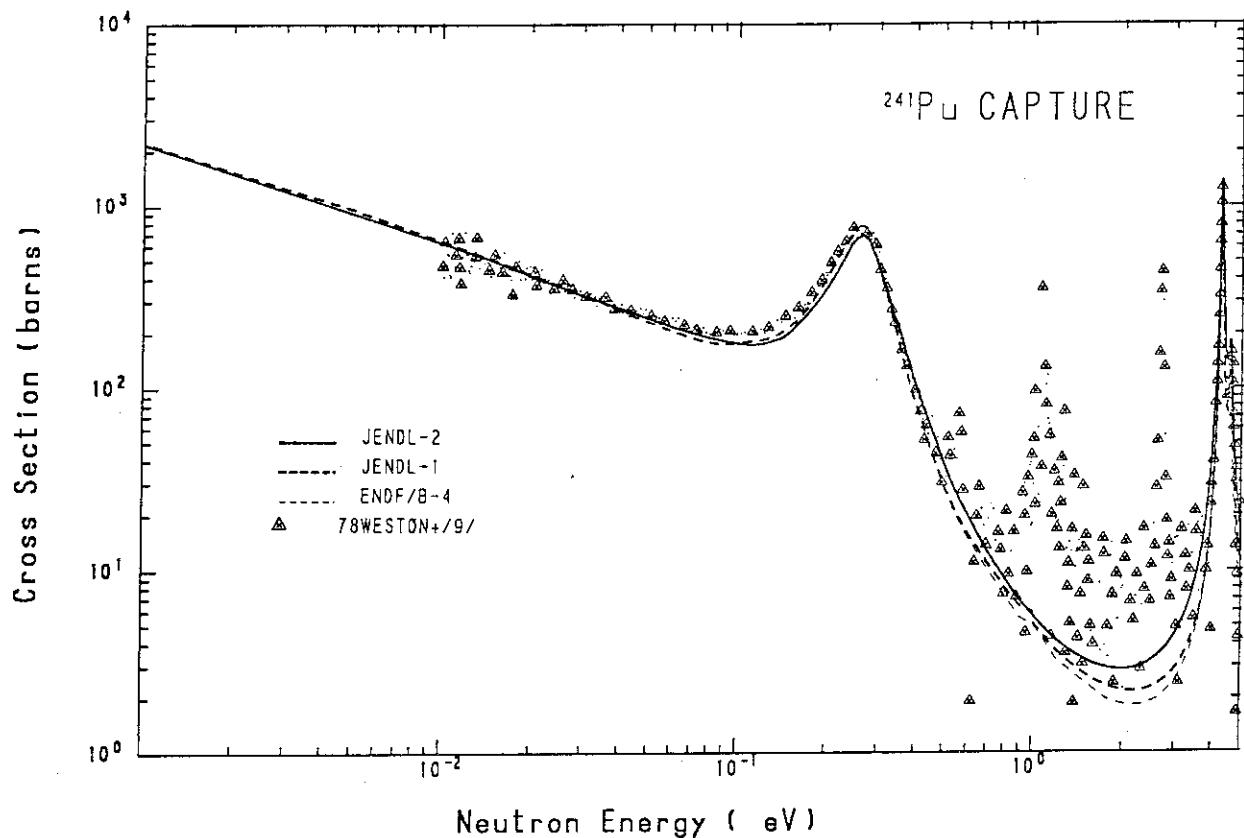

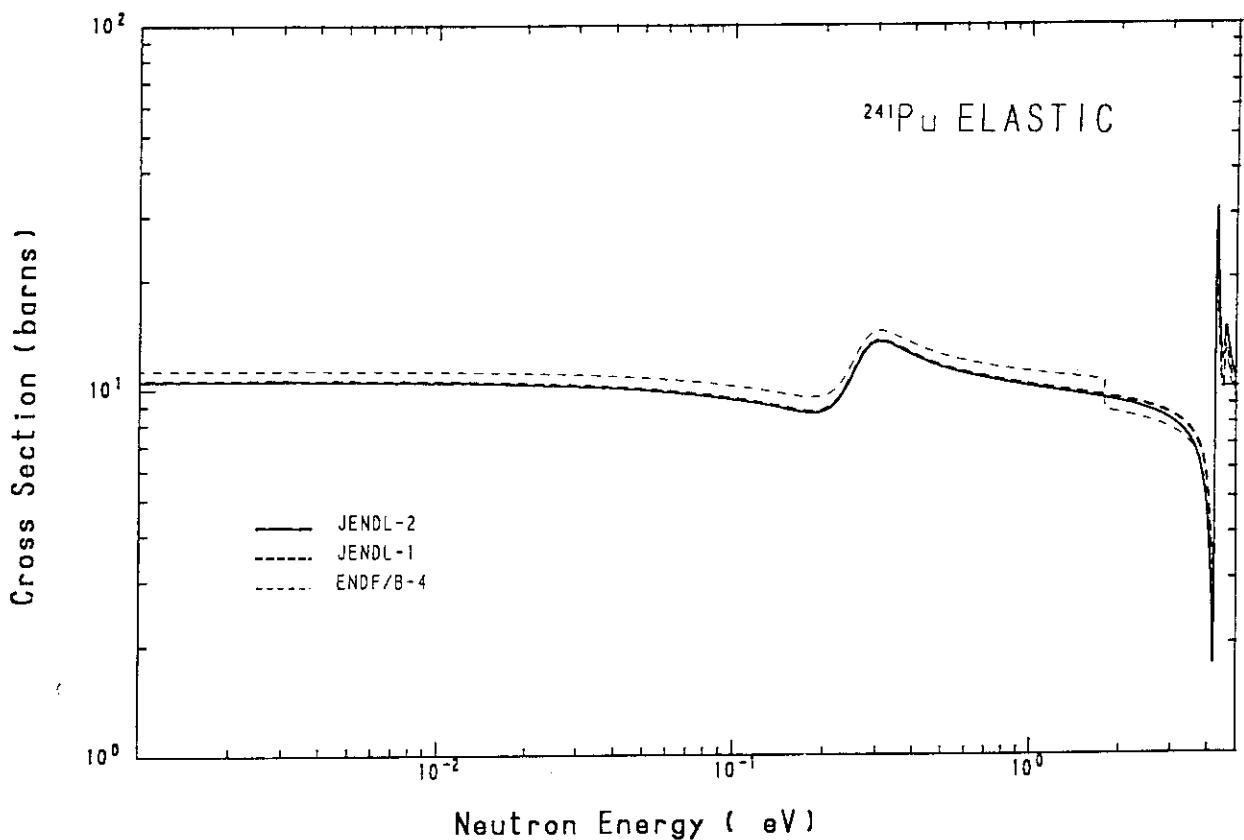

b) Level density parameters of Pu isotopes.

Isotope	238	239	240	241	242
a (MeV $^{-1}$)	26.44	26.53	26.93	27.40	27.78
σ_M^2/\sqrt{U} (MeV $^{-1/2}$)	17.54	17.62	17.80	18.00	18.17
Δ (MeV)	1.10	0.61	1.04	0.61	1.11
E_x (MeV)	4.23	3.74	4.17	3.73	4.23
T_n (MeV)	0.412	0.411	0.407	0.403	0.399

c) Q-values and threshold energies of ^{241}Pu . (MeV)

	Q-value	Threshold energy
(n,2n)	-5.24	5.2619
(n,3n)	-11.77	11.819
(n,4n)	-17.43	17.503
