Microchemical Analysis of minerals from the Tsukiyoshi Fault zone in the Tono Mine and MIU-2 borehole.

三菱商事株式会社

要 旨

MIU-2 号孔, MIU-3 号孔および MIU-4 号孔を対象として, 月吉断層の調査を行った。この調査の主要な目的は以下の通りである;

- ・土岐花崗岩中において、断層を系統的に同定し、記録するとともに、水理学的に重要な特徴を抽出する。
- ・月吉断層の構造に関する概念モデルの構築を行うための基礎データの提供として、地質、地質構造、鉱物に関するデータをとりまとめる。
- ・正馬様用地に分布する土岐花崗岩中での断層の形成発達に関する考察を行う。

調査の結果、対象ボーリング孔の地質構造アトラスが作成された。また、MIU-4 号孔については、岩相と鉱物組成および地質構造の解析結果に基づいて、個別の水理地質帯に区分した。

MIU-2 号孔と MIU-4 号孔の観察により、月吉断層の活動および断裂を埋める鉱物形成は 7 つの段階に区分された。

また、MIU-2 号孔と MIU-4 号孔では、地下水流动経路となりうる地質構造の特徴を記載した。この結果、このような特徴として以下の 2 種類が認められた;

- ・開口割れ目によるもの。
- ・部分的に微小割れ目の発達する花崗岩中での方解石の溶解や微小割れ目に伴う空隙の多いゾーンによるもの。

本報告書は、三菱商事株式会社が核燃料サイクル開発機構との契約により実施した業務成果に関するものである。

Microchemical Analysis of minerals from the Tsukiyoshi Fault zone in the Tono Mine and MIU-2 borehole.

Mitsubishi Corporation

Abstract

The Tsukiyoshi fault intersections in the boreholes MIU-2, MIU-3 and MIU-4 were investigated with following main purposes;

- (1) to systematically identify and record the distribution of fault intersections, and features of potential hydrogeological significance.
- (2) to compile and integrate geological, structural, mineralogical observations in a "structural atlas" form in order to provide data to enable the development of a conceptual model of the geometry and architecture of the Tsukiyoshi Fault, and its associated fracture envelope.
- (3) to provide further insights into the age relationships of the faults and fracture mineralisation history of the Toki Granite at the Shobasama site.

As a result, a structural atlas graphic has been prepared for each holes. In addition, the data for MIU-4 have been interpreted to produce a further borehole graphic, which divides the Toki Granite and the Tsukiyoshi Fault into a series of discrete hydrogeological domains based on a combined consideration of the lithology, mineralogical evidence for groundwater movement and alteration characteristics, as well as the structural domain interpretation.

The additional observations recorded from MIU-2 and MIU-4 have also enabled the relative history of faulting and fracture mineralisation to be refined further. Seven broad fracturing events can now be distinguished.

The distribution of features considered to represent potentially flowing features has been systematically recorded from MIU-2 and MIU-4. This study now distinguishes two types:

- potentially flowing features associated with open fractures.
- potentially flowing features associated with zones of porous and friable granite formed by the dissolution of earlier calcite veins and microfractures, within locally intensely microfractured granite.

This work was performed by Mitsubishi Corporation under contract with Japan Nuclear Cycle Development Institute.

1 Introduction

This report presents the result of a mineralogical study conducted on drillcore samples from the Tsukiyoshi Fault zone from the MIU-2 borehole and the Tono Mine. Mineralogical analyses were carried out by electron probe microanalysis (EPMA) on seven samples (Table 1).

2 Method

2.1 Sample preparation

The EPMA analyses were all carried out at the British Geological Survey on polished thin sections. For this study the polished thin sections were carbon-coated prior to analysis. One sample (D903) is not in the form of a thin section but was a polished block of rock-chip mounted in resin. However this sample was treated in the same way for EPMA analysis.

2.2 Analytical techniques

The EPMA analyses were obtained using a Cameca SX50 wavelength dispersive electron microprobe. The rocks were analysed using an accelerating potential of 15kV and a 20nA beam current. A beam of diameter $\sim 0.25\mu\text{m}$ was used, however for some heat-sensitive minerals (e.g. calcite) the beam was broadened or 'defocused'. For example, a beam of diameter $12\mu\text{m}$ was used for the calcite analyses and $5\mu\text{m}$ for K-feldspar. Elements were analysed using the PET, LiF and TAP diffracting crystals, calibrated using well-characterised mineral standards, pure metals and synthetic oxides. The following oxides were determined by stoichiometry for each minerals: SiO_2 , TiO_2 , Al_2O_3 , FeO , MnO , MgO , Na_2O , P_2O_5 , BaO , SrO and Rb_2O . Due to interference effects from the large Si peak, the measured SrO data has had the following empirically derived correction factor applied:

$$\text{SrO (corrected)} = \text{SrO (measured)} - (\text{SiO}_2 \text{ (measured)} * 0.0062)$$

Thus the SrO data is presented as SrO (measured) and SrO (corrected), and the Total for each analysis is presented as Total (measured) and Total (corrected).

3 Results

Table 1 provides a summary of the EPMA analysis of the samples from the Tsukiyoshi Fault zone. The full data are presented in Table 2.

Note that some of the analysis totals are lower than would be expected from pristine fresh minerals (e.g. some feldspars totals are $<98\%$, and the majority of the biotite totals are $<95\%$) and this reflects analysis of primary minerals which have been altered to secondary composition (e.g. biotite altered to chlorite or clay minerals; feldspar altered to mica) and also have a significant degree of intracrystalline microporosity.

Table 1: Summary of microprobe analysis

Borehole	Sample code	Analyses	Minerals analysed
98SI-03	D899	n=32	K-feldspar, altered plagioclase biotite, matrix clay,
98SI-03	D903	n=17	calcite veins, ?zeolite/ altered feldspar; the low number of analyses reflects the overall fine grained nature of sample.
98SI-03	D902.1	n=29	feldspar clasts, calcite ('fibrous' vein type and nodular-in-vein type), sheared matrix clay
98FE-01	F522	n=29	altered biotite, K-feldspar, ?muscovite, plagioclase, ?chlorite
TH-2	F547	n=33	calcite ('fibrous' vein type and vein-core type), epidote, chlorite
MIU-2	F558	n=49	plagioclase, K-feldspar, altered biotite, calcite
TM-2	F534	n=28	altered biotite, plagioclase, muscovite, matrix clay, ?chlorite

The Appendix contains an annotated image of each sample illustrating each analysis location/area. These locations can be matched with the corresponding analyses by using the number given in the column in Table 2 marked 'Location'

Table 2: Microprobe Analyses

Appendix Analysis locations

Table 2 contains reference numbers under the heading ‘Location’. These numbers refer to the location on the sample that was analysed. This appendix contains an annotated image of each sample illustrating these locations. The locations are approximate within the limits of the resolution of the images and the fine grain size of the samples in some instances.
